**Service Information Summary**

A summary of information you need when you pull up to the fuel pump.
This Owner's Manual should be considered a permanent part of the car, and should remain with the car when it is sold.

This Owner's Manual covers all models of the Civic Hybrid. You may find descriptions of equipment and features that are not on your particular model.

The information and specifications included in this publication were in effect at the time of approval for printing. Honda Motor Co., Ltd. reserves the right, however, to discontinue or change specifications or design at any time without notice and without incurring any obligation whatsoever.
Congratulations! Your selection of a 2003 Honda Civic Hybrid was a wise investment. It will give you years of driving pleasure.

One of the best ways to enhance the enjoyment of your new Honda is to read this manual. In it, you will learn how to operate its driving controls and convenience items. Afterwards, keep this owner’s manual in your car so you can refer to it at any time.

Several warranties protect your new Honda. Read the warranty booklet thoroughly so you understand the coverages and are aware of your rights and responsibilities.

Maintaining your car according to the schedules given in this manual helps to keep your driving trouble-free while it preserves your investment. When your car needs maintenance, keep in mind that your Honda dealer’s staff is specially trained in servicing the many systems unique to your Honda. Your Honda dealer is dedicated to your satisfaction and will be pleased to answer any questions and concerns.

California Proposition 65 Warning

**WARNING**: This product contains or emits chemicals known to the State of California to cause cancer and birth defects or other reproductive harm.
To help you make informed decisions about safety, we have provided operating procedures and other information on labels and in this manual. This information alerts you to potential hazards that could hurt you or others.

Of course, it is not practical or possible to warn you about all the hazards associated with operating or maintaining your car. You must use your own good judgement.

You will find this important safety information in a variety of forms, including:

- **Safety Labels** — on the car.
- **Safety Messages** — preceded by a safety alert symbol ▶️ and one of three signal words: DANGER, WARNING, or CAUTION.

These signal words mean:

- **DANGER**
  
  You WILL be KILLED or SERIOUSLY HURT if you don’t follow instructions.

- **WARNING**
  
  You CAN be KILLED or SERIOUSLY HURT if you don’t follow instructions.

- **CAUTION**
  
  You CAN be HURT if you don’t follow instructions.

- **Safety Headings** — such as Important Safety Reminders or Important Safety Precautions.
- **Safety Section** — such as Driver and Passenger Safety.
- **Instructions** — how to use this car correctly and safely.

This entire book is filled with important safety information — please read it carefully.
Main Menu

Your Car at a Glance

- **Airbags** (P. 10, 48)
- **Power Door Lock Switch** (P. 87)
- **Power Window Switches** (P. 97)
- **Fuel Fill Door Release** (P. 145)
- **Trunk Release** (P. 92)
- **Hood Release Handle** (P. 146)
- **Automatic Transmission (CVT)** (P. 108)
- **Manual Transmission** (P. 162)
- **Heating/Cooling Controls** (P. 166)
- **Audio System** (P. 118)
- **Digital Clock** (P. 123)
This section gives you important information about how to protect yourself and your passengers. It shows you how to use seat belts properly. It explains your Supple-mental Restraint System. And it tells you how to properly restrain infants and children in your car.
You’ll find many safety recommendations throughout this section, and throughout this manual. The recommendations on this page are the ones we consider to be the most important.

**Always Wear Your Seat Belt**
A seat belt is your best protection in all types of collisions. Airbags supplement seat belts, but airbags are designed to inflate only in a moderate to severe frontal collision. So even though your car is equipped with airbags, make sure you and your passengers always wear your seat belts, and wear them properly. (See page 16.)

**Restrain All Children**
Children are safest when they are properly restrained in the back seat, not the front seat. A child who is too small for a seat belt must be properly restrained in a child safety seat. (See page 22.)

**Be Aware of Airbag Hazards**
While airbags can save lives, they can cause serious or fatal injuries to occupants who sit too close to them, or are not properly restrained. Infants, young children, and short adults are at the greatest risk. Be sure to follow all instructions and warnings in this manual. (See page 10.)

**Don’t Drink and Drive**
Alcohol and driving don’t mix. Even one drink can reduce your ability to respond to changing conditions, and your reaction time gets worse with every additional drink. So don’t drink and drive, and don’t let your friends drink and drive, either.

**Control Your Speed**
Excessive speed is a major factor in crash injuries and deaths. Generally, the higher the speed the greater the risk, but serious accidents can also occur at lower speeds. Never drive faster than is safe for current conditions, regardless of the maximum speed posted.

**Keep Your Car in Safe Condition**
Having a tire blowout or a mechanical failure can be extremely hazardous. To reduce the possibility of such problems, check your tire pressures and condition frequently, and perform all regularly scheduled maintenance. (See page 186.)
Your car is equipped with many features that work together to protect you and your passengers during a crash.

Some safety features do not require any action on your part. These include a strong steel framework that forms a safety cage around the passenger compartment; front and rear crush zones that are designed to crumple and absorb energy during a crash; a collapsible steering column; and seat belt tensioners that automatically tighten the front seat belts in the event of a crash.
These safety features are designed to reduce the severity of injuries in a crash. However, you and your passengers can’t take full advantage of these safety features unless you remain sitting in a proper position and **always wear your seat belts properly**. In fact, some safety features can contribute to injuries if they are not used properly.

**Seat Belts**
For your safety, and the safety of your passengers, your car is equipped with seat belts in all seating positions.

Your seat belt system also includes a light on the instrument panel to remind you and your passengers to fasten your seat belts.

**Why Wear Seat Belts**
Seat belts are the single most effective safety device for adults and larger children. (Infants and smaller children must be properly restrained in child seats.)

Not wearing a seat belt properly increases the chance of serious injury or death in a crash, even though your car has airbags.

In addition, most states and all Canadian provinces require you to wear seat belts.
When properly worn, seat belts:

• Keep you connected to the vehicle so you can take advantage of the vehicle's built-in safety features.

• Help protect you in almost every type of crash, including frontal, side, and rear impacts and rollovers.

• Help keep you from being thrown against the inside of the vehicle and against other occupants.

• Keep you from being thrown out of the vehicle.

• Help keep you in a good position should the airbags ever deploy. A good position reduces the risk of injury from an inflating airbag, and allows you to get the best advantage from the airbag.

Of course, seat belts cannot completely protect you in every crash. But in most cases, seat belts can reduce your risk of serious injury.

**What you should do:** Always wear your seat belt, and make sure you wear it properly.
Airbags

Your car has a Supplemental Restraint System (SRS) with dual-stage, dual-threshold front airbags to help protect the heads and chests of the driver and a front seat passenger during a moderate to severe frontal collision.

Only on U.S. models equipped with side airbags.
Your car also has side airbags to help protect the upper torso of the driver or a front seat passenger during a moderate to severe side impact.

The most important things you need to know about your airbags are:

- **Airbags do not replace seat belts.** They are designed to supplement the seat belts.

- **Airbags offer no protection in rear impacts, rollovers, or minor frontal or side collisions.**

- **Airbags can pose serious hazards.** To do their job, airbags must inflate with tremendous force and speed. So while airbags help save lives, they can cause minor injuries, or more serious or even fatal injuries if occupants are not properly restrained or sitting properly.

What you should do: Always wear your seat belt properly, and sit upright and as far back as possible from the steering wheel or dashboard.
Seats & Seat-Backs
Your car’s seats are designed to keep you in a comfortable, upright position so you can take full advantage of the protection offered by seat belts and the energy absorbing materials in the seats.

How you adjust your seats and seat-backs can also affect your safety. For example, sitting too close to the steering wheel or dashboard increases the risk of you or your passenger being injured by striking the inside of the car, or by an inflating airbag.

Reclining a seat-back too far reduces the seat belt’s effectiveness and increases the chance that the seat’s occupant will slide under the seat belt in a crash and be seriously injured.

What you should do: Move the front seats as far back as possible, and keep adjustable seat-backs in an upright position whenever the car is moving.

Head Restraints
Head restraints can help protect you from whiplash and other injuries. For maximum protection, the back of your head should rest against the center of the head restraint.

Door Locks
Keeping your doors locked reduces the chance of being thrown out of the car during a crash. It also helps prevent occupants from accidentally opening a door and falling out, and outsiders from unexpectedly opening your doors.
Pre-Drive Safety Checklist
To make sure you and your passengers get the maximum protection from your car's safety features, check the following each time before you drive away:

- All adults, and children who have outgrown child safety seats, are wearing their seat belts and wearing them properly (see page 16).
- Any infant or small child is properly restrained in a child seat in the back seat (see page 22).
- Front seat occupants are sitting upright and as far back as possible from the steering wheel and dashboard (see page 13).
- Seat-backs are upright (see page 15).
- Head restraints are properly adjusted (see page 16).
- All doors are closed and locked (see page 13).
- All cargo is properly stored or secured (see page 154).

The rest of this section gives more detailed information about how you can maximize your safety.

Remember, however, that no safety system can prevent all injuries or deaths that can occur in severe crashes, even when seat belts are properly worn and the airbags deploy.
Introduction
The following pages provide instructions on how to properly protect the driver and other adult occupants.

These instructions also apply to children who have outgrown child seats and are large enough to wear lap/shoulder belts. (See page 38 for important additional guidelines on how to properly protect larger children.)

1. Close and Lock the Doors
After everyone has entered the car, be sure the doors are closed and locked.

For safety, locking the doors reduces the chance that a passenger, especially a child, will open a door while the car is moving and accidentally fall out. It also reduces the chance of someone being thrown out of the car during a crash.

For security, locked doors can prevent an outsider from unexpectedly opening a door when you come to a stop.

See page 87 for how to lock the doors.

2. Adjust the Front Seats
Any driver who sits too close to the steering wheel is at risk of being seriously injured or killed by striking the steering wheel or from being struck by an inflating front airbag during a crash.

CONTINUED
To reduce the chance of injury, wear your seat belt properly, sit upright with your back against the seat, and move the seat away from the steering wheel to the farthest distance that allows you to maintain full control of the car.

The National Highway Traffic Safety Administration and Transport Canada recommend that drivers adjust the seat so the center of the chest is at least 10 inches (25 cm) away from the center of the steering wheel. Also make sure your front seat passenger moves the seat as far to the rear as possible.

Most shorter drivers can get far enough away from the steering wheel and still reach the pedals. However, if you are concerned about sitting too close, we recommend that you investigate whether some type of adaptive equipment may help.

Once your seat is adjusted correctly, rock it back and forth to make sure the seat is locked in position.

See page 94 for how to adjust the front seats.
3. Adjust the Seat-Backs

A front passenger should also adjust the seat-back to an upright position, but as far from the dashboard as possible. A passenger who sits too close to the dashboard could be injured if the front airbag inflates.

Reclining a seat-back so that the shoulder part of the belt no longer rests against the occupant’s chest reduces the protective capability of the belt. It also increases the chance of sliding under the belt in a crash and being seriously injured. The farther a seat-back is reclined, the greater the risk of injury.

Adjust the driver’s seat-back to a comfortable, upright position, leaving ample space between your chest and the airbag cover in the center of the steering wheel. If you sit too close to the steering wheel, you could be injured if the front airbag inflates.

WARNING

Reclining the seat-back too far can result in serious injury or death in a crash.

Adjust the seat-back to an upright position and sit well back in the seat.

See page 94 for how to adjust seat-backs.
4. Adjust the Head Restraints

Before driving, make sure everyone with an adjustable head restraint has properly positioned the head restraint. The restraint should be positioned so the back of the occupant’s head rests against the center of the restraint. A taller person should adjust the restraint as high as possible.

5. Fasten and Position the Seat Belts

Insert the latch plate into the buckle, then tug on the belt to make sure the belt is securely latched. Also check that the belt is not twisted, because a twisted belt can cause serious injuries in a crash.

Properly adjusted head restraints will help protect occupants from whiplash and other crash injuries.

See page 96 for how to adjust the head restraints.

\textbf{WARNING}

Improperly positioning head restraints reduces their effectiveness and you can be seriously injured in a crash.

Make sure head restraints are in place and positioned properly before driving.
Position the lap part of the belt as low as possible across your hips, then pull up on the shoulder part of the belt so the lap part fits snugly. This lets your strong pelvic bones take the force of a crash and reduces the chance of internal injuries.

If necessary, pull up on the belt again to remove any slack from the shoulder part, then check that the belt rests across the center of your chest and over your shoulder. This spreads the forces of a crash over the strongest bones in your upper body.

**WARNING**

Improperly positioning the seat belts can cause serious injury or death in a crash.

Make sure all seat belts are properly positioned before driving.

If the seat belt touches or crosses your neck, or if it crosses your arm instead of your shoulder, you need to adjust the seat belt anchor height.

To adjust the height of a front seat belt anchor, squeeze the two release buttons and slide the anchor up or down as needed (it has four positions).

CONTINUED
Never place the shoulder portion of a lap/shoulder belt under your arm or behind your back. This could cause very serious injuries in a crash.

If a seat belt does not seem to work as it should, it may not protect the occupant in a crash. No one should sit in a seat with an inoperative seat belt. Anyone using a seat belt that is not working properly can be seriously injured or killed. Have your Honda dealer check the belt as soon as possible.

See page 45 for additional information about your seat belt system and how to take care of your belts.

Adjust the steering wheel, if needed, so that the wheel points toward your chest, not toward your face.

Pointing the steering wheel toward your chest provides optimal protection from the airbag.

See page 82 for how to adjust the steering wheel.
7. Maintain a Proper Sitting Position
After all occupants have adjusted their seats and put on seat belts, it is very important that they continue to sit upright, well back in their seats, with their feet on the floor, until the car is parked and the engine is off.

Sitting improperly can increase the chance of injury during a crash. For example, if an occupant slouches, lies down, turns sideways, sits forward, leans forward or sideways, or puts one or both feet up, the chance of injury during a crash is greatly increased.

In addition, an occupant who is out of position in the front seat can be seriously or fatally injured by striking interior parts of the car, or by being struck by an inflating front airbag. Being struck by an inflating side airbag can result in possibly serious injuries.

**WARNING**

Sitting improperly or out of position can result in serious injury or death in a crash.

Always sit upright, well back in the seat, with your feet on the floor.

Remember, to get the best protection from your car’s airbags and other safety features, you must sit properly and wear your seat belt properly.
Advice for Pregnant Women

Because protecting the mother is the best way to protect her unborn child, a pregnant woman should always wear a seat belt whenever she drives or rides in a vehicle.

Remember to keep the lap portion of the belt as low as possible across your hips.

Pregnant women should also sit upright and as far back as possible from the steering wheel or dashboard. This will reduce the risk of injuries to both the mother and her unborn child that can be caused by a crash or an inflating airbag.

Each time you have a check-up, ask your doctor if it’s okay for you to drive.

Additional Safety Precautions

- **Two people should never use the same seat belt.** If they do, they could be very seriously injured in a crash.

- **Do not put any accessories on seat belts.** Devices intended to improve occupant comfort or reposition the shoulder part of a seat belt can severely compromise the protective capability of the seat belt and increase the chance of serious injury in a crash.
• Do not place hard or sharp objects between yourself and a front airbag. Carrying hard or sharp objects on your lap, or driving with a pipe or other sharp object in your mouth, can result in injuries if your front airbag inflates.

• Do not attach or place objects on the front airbag covers. Any object attached to or placed on the covers marked “SRS AIRBAG” in the center of the steering wheel and on top of the dashboard could interfere with the proper operation of the airbags. Or, if the airbags inflate, the objects could be propelled inside the car and hurt someone.

• On U.S. models with side airbags, do not attach hard objects on or near a front door. If a side airbag inflates, a cup holder or other hard object attached on or near the door could be propelled inside the car and hurt someone.

• Keep your hands and arms away from the airbag covers. If your hands or arms are close to the airbag cover in the center of the steering wheel or on top of the dashboard, they could be injured if the front airbag inflates.
To reduce the number of child deaths and injuries, every state and Canadian province requires that infants and children be restrained whenever they ride in a vehicle.

Each year, many children are injured or killed in vehicle crashes because they are either unrestrained or not properly restrained. In fact, vehicle accidents are the number one cause of death of children ages 12 and under.

To reduce the number of child deaths and injuries, every state and Canadian province requires that infants and children be restrained whenever they ride in a vehicle.

Children depend on adults to protect them. However, despite their best intentions, many parents and other adults may not know how to properly protect young passengers.

So if you have children, or if you ever need to drive with a grandchild or other children in your car, be sure to read this section.

**WARNING**

Children who are unrestrained or improperly restrained can be seriously injured or killed in a crash.

Any child too small for a seat belt should be properly restrained in a child seat. A larger child should be properly restrained with a seat belt.

**All Children Must Be Restrained**

Each year, many children are injured or killed in vehicle crashes because they are either unrestrained or not properly restrained. In fact, vehicle accidents are the number one cause of death of children ages 12 and under.

To reduce the number of child deaths and injuries, every state and Canadian province requires that infants and children be restrained whenever they ride in a vehicle.

*Any child who is too small to wear a seat belt should be properly restrained in a child seat.* (See page 27.)

*A larger child should always be restrained with a seat belt and use a booster seat, if needed.* (See page 38.)
Protecting Children

Additional Precautions to Parents

- **Never hold an infant or child on your lap.** If you are not wearing a seat belt in a crash, you could be thrown forward into the dashboard and crush the child.

  If you are wearing a seat belt, the child can be torn from your arms during a crash. For example, if your car crashes into a parked vehicle at 30 mph (48 km/h), a 20-lb (9 kg) infant will become a 600-lb (275 kg) force, and you will not be able to hold on.

- **Never put a seat belt over yourself and an infant or child.** During a crash, the belt could press deep into the child and cause very serious injuries.

Children Should Sit in the Back Seat

According to accident statistics, children of all ages and sizes are safer when they are restrained in the back seat, not the front seat. The National Highway Traffic Safety Administration and Transport Canada recommend that all children ages 12 and under be properly restrained in the back seat.

In the back seat, children are less likely to be injured by striking hard interior parts during a collision or hard braking. Also, children cannot be injured by an inflating airbag when they ride in the back.

The Passenger’s Front Airbag Poses Serious Risks to Children

Front airbags have been designed to help protect adults in a moderate to severe frontal collision. To do this, the passenger’s front airbag is quite large, and it inflates with tremendous speed.

**Infants**

Never put a rear-facing child seat in the front seat of a vehicle equipped with a passenger’s front airbag. If the airbag inflates, it can hit the back of the child seat with enough force to kill or very seriously injure an infant.

CONTINUED
Protecting Children

Small Children
Placing a forward-facing child seat in the front seat of a vehicle equipped with a passenger’s front airbag can be hazardous. If the vehicle seat is too far forward, or the child's head is thrown forward during a collision, an inflating front airbag can strike the child with enough force to kill or very seriously injure a small child.

Larger Children
Children who have outgrown child seats are also at risk of being injured or killed by an inflating passenger’s front airbag. Whenever possible, larger children should sit in the back seat, in a booster seat if needed, and be properly restrained with a seat belt. (See page 38 for important information about protecting larger children.)

U.S. Models
To remind you of the passenger’s front airbag hazards, and that children must be properly restrained in the back seat, your car has warning labels on the dashboard and on the driver's and front passenger's visors. Please read and follow the instructions on these labels.

WARNING
DEATH or SERIOUS INJURY can occur
• Children 12 and under can be killed by an airbag
• The BACK SEAT is the SAFEST place for children
• NEVER put a rear-facing child seat in the front
• Sit as far back as possible from the airbag
• ALWAYS use Seat Belts and Child Restraints

WARNING
Children Can Be KILLED or INJURED by Passenger Air Bag
• The back seat is the safest place for children 12 and under.
• Make sure all children use seat belts or child seats.

To be removed by owner only.
To remind you of the front airbag hazards, your car has warning labels on the driver’s and front passenger’s visors. Please read and follow the instructions on these labels.

If You Must Drive with Several Children
Your car has three seating positions in the back seat where children can be properly restrained.

If you ever have to carry more than three children in your car:

- Place the largest child in the front seat, provided the child is large enough to wear a seat belt properly (see page 38).
- Move the vehicle seat as far to the rear as possible (see page 13).
- Have the child sit upright and well back in the seat (see page 19).
- Make sure the seat belt is properly positioned and secured (see page 16).

</tbody>
</table>
If a Child Requires Close Attention
Many parents say they prefer to put an infant or small child in the front passenger seat so they can watch the child, or because the child requires attention.

Placing a child in the front seat exposes the child to hazards from the passenger’s front airbag, and paying close attention to a child distracts the driver from the important tasks of driving, placing both of you at risk.

If a child requires physical attention or frequent visual contact, we strongly recommend that another adult ride with the child in the back seat. The back seat is far safer for a child than the front.

Additional Safety Precautions
- **Use childproof door locks to prevent children from opening the doors.** Using this feature will prevent children from opening the doors and accidentally falling out (see page 92).
- **Use the main power window switch to prevent children from opening the rear windows.** Using this feature will prevent children from playing with the windows, which could expose them to hazards or distract the driver (see page 98).
- **Do not leave children alone in your vehicle.** Leaving children without adult supervision is illegal in most states and Canadian provinces, and can be very hazardous. For example, infants and small children left in a vehicle on a hot day can die from heatstroke. And children left alone with the key in the ignition can accidentally set the vehicle in motion, possibly injuring themselves or others.
- **Lock all doors and the trunk when your vehicle is not in use.** Children who play in cars can accidentally get trapped inside the trunk and be seriously injured or could die. Teach your children not to play in or around cars. Know how to operate the emergency trunk opener (U.S. models only) and decide if your children should be shown how to use this feature (see page 93).
- **Keep car keys and remote transmitters out of the reach of children.** Even very young children learn how to unlock vehicle doors, turn on the ignition, and open the trunk, which can lead to accidental injury or death.
**General Guidelines for Using Child Seats**
The following pages give general guidelines for selecting and installing child seats for infants and small children.

**Selecting a Child Seat**
To provide proper protection, a child seat should meet three requirements:

2. **The child seat should be of the proper type and size to fit the child.**

**Infants:** Children up to about one year old should be restrained in a rear-facing, reclining child seat. Only a rear-facing seat provides the proper support to protect an infant’s head, neck, and back. See page 31 for additional information on protecting infants.

CONTINUED
Before purchasing a child seat, we recommend that parents test the child seat in the specific vehicle seating position (or positions) where they intend to use the seat. If a previously purchased child seat does not fit, you may need to buy a different one that will fit.

Due to variations in the design of child seats, vehicle seats, and seat belts, all child seats will not fit all vehicle seating positions.

However, Honda is confident that one or more child seat models can fit and be properly installed in all recommended seating positions in your car.

Your car has lower anchors installed for use with LATCH (Lower Anchors and Tethers for Children) - compatible child seats. For more information, see page 43.

Small Children: A child who is too large for a rear-facing child seat, and who can sit up without support, should be restrained in a forward-facing child seat. See page 35 for additional information on protecting small children.
**Placing a Child Seat**
This page briefly summarizes Honda’s recommendations on where to place rear-facing and forward-facing child seats in your car.

**Airbags Pose Serious Risks to Children**
The passenger’s front airbag inflates with enough force to kill or seriously injure an infant in a rear-facing child seat.

A small child in a forward-facing child seat is also at risk. If the vehicle seat is too far forward, or the child’s head is thrown forward during a collision, an inflating front airbag can kill or seriously injure the child.

If a small child must ride in the front, follow the instructions provided in this section.

**Front Passenger’s Seat**
**Infants:** Never in the front seat, due to the front airbag hazard.

**Small children:** Not recommended, due to the front airbag hazard. If a small child must ride in front, move the vehicle seat to the rear-most position and secure a forward-facing child seat with the seat belt (see page 36).

**Back Seats**
**Infants:** Recommended positions. Properly secure a rear-facing child seat (see page 32).

**Small children:** Recommended positions. Properly secure a forward-facing child seat (see page 36).

CONTINUED
Installing a Child Seat

After selecting a proper child seat, and a good position to install the seat, there are three main steps in installing the seat:

1. **Properly secure the child seat to the car.** All child seats are designed to be secured to the car with the lap part of a lap/shoulder belt. Some child seats can be secured to the vehicle’s LATCH anchorage system instead. A child whose seat is not properly secured to the car can be endangered in a crash. See pages 32, 36 and 43 for instructions on how to properly secure child seats in this car.

2. **Make sure the child seat is firmly secured.** After installing a child seat, push and pull the seat forward and from side to side to verify that it is secure.

3. **Secure the child in the child seat.** To provide security during normal driving maneuvers as well as during a collision, we recommend that parents secure a child seat as firmly as possible.

   However, a child seat does not need to be “rock solid.” In some vehicles or seating positions, it may be difficult to install a child seat so that it does not move at all. Some side-to-side or back-and-forth movement can be expected and should not reduce the child seat’s effectiveness.

   If the child seat is not secure, try installing it in a different seating position, or use a different style of child seat that can be firmly secured in the desired seating position.

Storing a Child Seat

When you are not using a child seat, either remove it and store it in a safe place, or make sure it is properly secured. An unsecured child seat can be thrown around the car during a crash or sudden stop and injure someone.
Protecting Infants

Only a rear-facing child seat provides proper support for a baby’s head, neck, and back. Infants up to about one year of age must be restrained in a rear-facing child seat.

Two types of seats may be used: a seat designed exclusively for infants, or a convertible seat used in the rear-facing, reclining mode.

**Child Seat Type**

**WARNING**

Placing a rear-facing child seat in the front seat can result in serious injury or death if the passenger’s front airbag inflates.

Always place a rear-facing child seat in the back seat, not the front.

We recommend that an infant be restrained in a rear-facing child seat until the infant is at least one year old, reaches the seat maker’s weight or height limit, and is able to sit up without support.

**Rear-Facing Child Seat Placement**

In this car, a rear-facing child seat can be placed in any seating position in the back seat, but not in the front seat.

*Never put a rear-facing child seat in the front seat.* If the passenger’s front airbag inflates, it can hit the back of the child seat with enough force to kill or seriously injure an infant. If an infant must be closely watched, we recommend that another adult sit in the back seat with the baby.

*Do not put a rear-facing child seat in a forward-facing position.* If placed facing forward, an infant could be very seriously injured during a frontal collision.

CONTINUED
When properly installed, a rear-facing child seat may prevent the driver or a front-seat passenger from moving the seat as far back as recommended (see page 13). Or it may prevent them from locking the seat-back in the desired upright position (see page 15).

In either case, we recommend that you place the child seat directly behind the front passenger seat, move the front seat as far forward as needed, and leave it unoccupied. Or you may wish to get a smaller child seat that allows you to safely carry a front passenger.

**Rear-Facing Child Seat Installation**

The lap/shoulder belts in the back seats have a locking mechanism that must be activated to secure a child seat.

The following pages provide instructions and tips on how to secure a rear-facing child seat with this type of seat belt.

If you have a child seat designed to be attached to the vehicle’s LATCH anchorage system, follow the instructions on page 43.

1. With the child seat in the desired back seating position, route the belt through the child seat according to the seat maker’s instructions, then insert the latch plate into the buckle.
2. To activate the lockable retractor, slowly pull the shoulder part of the belt all the way out until it stops, then let the belt feed back into the retractor (you might hear a clicking noise as the belt retracts).

3. After the belt has retracted, tug on it. If the belt is locked, you will not be able to pull it out. If you can pull the belt out, it is not locked and you will need to repeat these steps.

4. After confirming that the belt is locked, grab the shoulder part of the belt near the buckle and pull up to remove any slack from the lap part of the belt. Remember, if the lap part of the belt is not tight, the child seat will not be secure. To remove slack, it may help to put weight on the child seat, or push on the back of the seat, while pulling up on the belt.

5. Push and pull the child seat forward and from side to side to verify that it is secure enough to stay upright during normal driving maneuvers. If the child seat is not secure, unlatch the belt, allow it to retract fully, then repeat these steps.

CONTINUED
To deactivate the locking mechanism and remove a child seat, un latch the buckle, unroute the seat belt, and let the belt fully retract.

**Rear-Facing Child Seat Installation Tips**

For proper protection, an infant must ride in a reclined, or semi-reclined position. To determine the proper reclining angle, check with the baby’s doctor or follow the seat maker’s recommendations.

To achieve the desired reclining angle, it may help to put a rolled up towel under the toe of the child seat, as shown.
In this car, the best place to install a forward-facing child seat is in one of the seating positions in the back seat. If the vehicle seat is too far forward, or the child’s head is thrown forward during a collision, an inflating front airbag can strike the child with enough force to cause very serious or fatal injuries. If a small child must be closely watched, we recommend that another adult sit in the back seat with the child.

Of the different seats available, we recommend those that have a five-point harness system as shown.

We also recommend that a small child stay in the child seat as long as possible, until the child reaches the weight or height limit for the seat.

**Child Seat Type**

A child at least one year old who can sit up without support, and who fits within the child seat maker’s weight and height limits, should be restrained in a forward-facing, upright child seat.

**Child Seat Placement**

In this car, the best place to install a forward-facing child seat is in one of the seating positions in the back seat.

**Placing a forward-facing child seat in the front seat of a vehicle equipped with a passenger’s front airbag can be hazardous.** If the vehicle seat is too far forward, or the child’s head is thrown forward during a collision, an inflating front airbag can strike the child with enough force to cause very serious or fatal injuries. If a small child must be closely watched, we recommend that another adult sit in the back seat with the child.
With the child seat in the desired seating position, route the belt through the child seat according to the seat maker's instructions, then insert the latch plate into the buckle.

The lap/shoulder belts in the back and front passenger seating positions have a locking mechanism that must be activated to secure a child seat.

The following pages provide instructions on how to secure a forward-facing child seat with this type of seat belt.

If you have a child seat designed to be attached to the vehicle's LATCH anchorage system, follow the instructions on page 43.

1. With the child seat in the desired seating position, route the belt through the child seat according to the seat maker's instructions, then insert the latch plate into the buckle.

**WARNING**

Improperly placing a forward-facing child seat in the front seat can result in serious injury or death if the front airbags inflate.

If you must place a forward-facing child seat in front, move the vehicle seat as far back as possible and properly restrain the child.

If it is necessary to put a forward-facing child seat in the front, move the vehicle seat as far to the rear as possible, be sure the child seat is firmly secured to the car, and the child is properly strapped in the seat.

**Child Seat Installation**

Protecting Children
2. To activate the lockable retractor, slowly pull the shoulder part of the belt all the way out until it stops, then let the belt feed back into the retractor (you might hear a clicking noise as the belt retracts).

3. After the belt has retracted, tug on it. If the belt is locked, you will not be able to pull it out. If you can pull the belt out, it is not locked and you will need to repeat these steps.

4. After confirming that the belt is locked, grab the shoulder part of the belt near the buckle and pull up to remove any slack from the lap part of the belt. Remember, if the lap part of the belt is not tight, the child seat will not be secure. It may help to put weight on the child seat, or push on the back of the seat, while pulling up on the belt.

5. Push and pull the child seat forward and from side to side to verify that it is secure enough to stay upright during normal driving maneuvers. If the child seat is not secure, unlatch the belt, allow it to retract fully, then repeat these steps.

CONTINUED
To deactivate the locking mechanism in order to remove a child restraint system, unlatch the buckle, unrout the seat belt, and let the belt fully retract.

**Protecting Larger Children**

When a child reaches the recommended weight or height limit for a forward-facing child seat, the child should sit in the back seat on a booster and wear a lap/shoulder belt.

We recommend that the child use a booster seat until the child is tall enough to use the seat belt without a booster.

The following pages give instructions on how to check proper seat belt fit, what kind of booster seat to use if one is needed, and important precautions for a child who must sit in the front seat.

**WARNING**

Allowing a larger child to sit improperly in the front seat can result in injury or death if the passenger’s front airbag inflates.

If a larger child must sit in front, make sure the child moves the seat as far back as possible, uses a booster seat if needed, and wears the seat belt properly.
Checking Seat Belt Fit

To determine if a lap/shoulder belt properly fits a child, have the child sit in the rear seat, all the way back against the seat and put on the seat belt. Follow the instructions on page 16. Then check how the belt fits.

If the shoulder part of the belt rests over the child’s collarbone and against the center of the chest, and the lap belt rests over the child’s hipbones and touches the tops of the thighs as shown, the child is probably big enough to wear the seat belt.

However, if the shoulder belt touches or crosses the child’s neck, or if the lap belt crosses the child’s stomach, the child needs to use a booster seat.

Do not let a child wear a seat belt across the neck or over the stomach. This could result in serious neck and internal injuries during a crash.

Do not let a child put the shoulder part of a seat belt behind the back or under the arm. This could cause very serious injuries during a crash. It also increases the chance that the child will slide under the belt in a crash and be injured.

Do not put any accessories on a seat belt. Devices intended to improve occupant comfort or reposition the shoulder part of a seat belt, severely compromise the protective capability of the seat belt and increase the chance of serious injury in a crash.

Two children should never use the same seat belt. If they do, they could be very seriously injured in a crash.

CONTINUED
Using a Booster Seat

A child should continue using a booster seat until the child exceeds the booster seat manufacturer’s requirements.

Even then, the child may still need to use a booster seat. Note that some states now require children to use boosters until they reach a certain age and/or weight. Be sure to check current laws in the state or states where you intend to drive.

If a child needs a booster seat, we recommend choosing a high or low-back style that allows the child to be directly secured with the lap/shoulder belt.

Whichever style you select, follow the booster seat maker’s instructions.

When Can a Larger Child Sit in Front

The National Highway Traffic Safety Administration and Transport Canada recommend that all children ages 12 and under be properly restrained in the back seat.

The back seat is the safest place for a child of any age or size.

In addition, the passenger's front airbag poses serious risks to children. If the seat is too far forward, or the child's head is thrown forward during a collision, or the child is unrestrained or out of position, an inflating front airbag can kill or seriously injure the child.

The side airbag also poses risks. If any part of a larger child's body is in the path of a deploying airbag, the child could receive possibly serious injuries.
Of course, children vary widely. And while age may be one indicator of when a child can safely ride in the front, there are other important factors you should consider.

**Physical Size**
Physically, a child must be large enough for the lap/shoulder belt to properly fit over the hips, chest, and shoulder (see pages 16 and 39). If the seat belt does not fit properly, the child should not sit in the front.

**Maturity**
To safely ride in front, a child must be able to follow the rules, including sitting properly and wearing the seat belt properly throughout a ride.

If you decide that a child can safely ride up front, be sure to:

- Carefully read the owner’s manual and make sure you understand all seat belt instructions and all safety information.
- Move the vehicle seat to the rear-most position.
- Have the child sit up straight, back against the seat, and feet on or near the floor.
- Check that the child’s seat belt is properly positioned and secured.
- If your car has side airbags, remind the child not to lean toward the door.
- Supervise the child. Even mature children sometimes need to be reminded to fasten the seat belts or sit properly.
Using Child Seats with Tethers

Your car has three tether anchorage points under the rear window for securing a tether-style child seat to the car.

Since a tether can provide additional security, we recommend using a tether whenever one is required or available. (Tethers are required in Canada.)

The tether anchor fittings are located under plastic covers. Pivot the cover backward to access the anchor fitting.

Attach the attaching clip to the tether anchorage point as shown in the illustration, then tighten the strap according to the child seat maker's instructions. Make sure the strap is not twisted.
Using LATCH

Your car is equipped with LATCH (Lower Anchors and Tethers for Children) at the outer rear seats. The lower anchors are located between the seat-back and seat bottom and are to be used only with a child seat designed for use with LATCH.

The exact location of each lower anchorage is marked with a small circle above the lower anchorage point.

To install a LATCH-compatible child seat:

1. Move the seat belt buckle or center seat belt away from the lower anchors.
2. Make sure there are no foreign objects around the anchors. Foreign objects could get in the way of a secure connection between the child seat and the anchors.
3. Put the child seat in the rear left or right vehicle seat and attach the child seat to the lower anchors according to the child seat maker's instructions.

CONTINUED
4. Follow the child seat maker’s instructions for any additional advice on adjusting or tightening the fit.

5. Attach the attaching clip to the tether anchor fitting and tighten the strap according to the child seat maker’s instructions. Make sure the strap is not twisted.

6. Push and pull the child seat forward and from side to side to verify that it is secure enough to stay upright during normal driving maneuvers.

This symbol on rear or forward facing child seats or booster cushions indicates the presence of LATCH compatible hardware.
Seat Belt System Components
Your seat belt system includes lap/shoulder belts in all five seating positions. The front seat belts are also equipped with automatic seat belt tensioners.

The seat belt system also includes a light on the instrument panel to remind you and your passengers to fasten your belts. If the driver’s seat belt is not fastened before the ignition is turned ON (II), the light will come on and a beeper will also sound. The beeper will stop after a few seconds, but the light will stay on until the driver’s seat belt is fastened.

Lap/Shoulder Belt

This seat belt has a single belt that goes over your shoulder, across your chest and across your hips.

To fasten the belt, insert the latch plate into the buckle, then tug on the belt to make sure the buckle is latched.

To lock the belt, push the red PRESS button on the buckle. Guide the belt across your body to the door pillar. After exiting the car, be sure the belt is out of the way and will not get closed in the door.

All seat belts have an emergency locking retractor. In normal driving, the retractor lets you move freely in your seat while it keeps some tension on the belt. During a collision or sudden stop, the retractor automatically locks the belt to help restrain your body.

The seat belts in all seating positions except the driver’s have an additional locking mechanism that must be activated to secure a child seat. (See pages 32 and 36 for instructions on how to secure child seats with this type of seat belt.)
If the shoulder part of the belt is pulled all the way out, the locking mechanism will activate. The belt will retract, but it will not allow the passenger to move freely.

To deactivate the locking mechanism, unlatch the buckle and let the seat belt fully retract. To refasten the belt, pull it out only as far as needed.

See page 16 for instructions on how to wear the lap/shoulder belt properly.

The tensioners are designed to activate primarily in frontal collisions. The tensioners are independent of the airbag system, so they can be activated during a collision that might not cause the airbags to deploy. In this case, the airbags would not be needed but the additional seat belt tension can be helpful.

The tensioners will be activated in a collision severe enough to cause the front airbags to inflate.

When the tensioners are activated, the seat belts will remain tight until they are unbuckled in the normal way.

For added protection, the front seat belts are equipped with automatic seat belt tensioners. When activated, the tensioners immediately tighten the belts to help hold the driver and a front passenger in place.

The SRS indicator light will come on if there is a problem with your automatic seat belt tensioners (see page 51).
Seat Belt Maintenance
For safety, you should check the condition of your seat belts regularly.

Pull each belt out fully and look for frays, cuts, burns, and wear. Check that the latches work smoothly and that the lap/shoulder belts retract easily. Any belt not in good condition or not working properly will not provide good protection and should be replaced as soon as possible.

U.S. Models
Honda provides a lifetime warranty on seat belts. Honda will repair or replace any seat belt component that fails to function properly during normal use. Please see your Honda Warranty Information booklet for details.

⚠️ WARNING
Not checking or maintaining seat belts can result in serious injury or death if the seat belts do not work properly when needed.

Check your seat belts regularly and have any problem corrected as soon as possible.

If a seat belt is worn during a crash, it must be replaced by the dealer. A belt that has been worn during a crash may not provide the same level of protection in a subsequent crash. The dealer should also inspect the anchors for damage and replace them if needed.

Automatic seat belt tensioners that deployed during a crash must be replaced.

For information on how to clean your seat belts, see page 250.
SRS Components
Your Supplemental Restraint System (SRS) includes:

• Two front airbags. The driver’s airbag is stored in the center of the steering wheel; the front passenger’s airbag is stored in the dashboard. Both are marked “SRS AIRBAG.”

• Automatic seat belt tensioners (see page 46).

• Sensors that can detect a moderate to severe frontal collision.

A sophisticated electronic system that continually monitors and records information about the sensors, the control unit, the airbag activators, and driver and passenger seat belt use when the ignition is ON (II).

• An indicator light on the instrument panel that alerts you to a possible problem with the system (see page 51).

• Emergency backup power in case your car’s electrical system is disconnected in a crash.

How Your Front Airbags Work

Your vehicle is equipped with dual-stage, dual-threshold airbags to help reduce the chance of airbag-caused injuries.

If you ever have a moderate to severe frontal collision, the sensors will detect the vehicle’s rapid deceleration. If the rate of deceleration is high enough, the control unit will instantly inflate the front airbags.
During a frontal crash, your seat belts help restrain your lower body and torso. Your airbag provides a cushion to help restrain and protect your head and chest.

Since both airbags use the same sensors, both airbags normally inflate at the same time. However, it is possible for only one airbag to inflate.

This can occur when the severity of a collision is at the margin, or threshold, that determines whether or not the airbags will deploy. In such cases, the seat belt will provide sufficient protection, and the supplemental protection offered by the airbag would be minimal.

After inflating, the front airbags immediately deflate, so they won’t interfere with the driver’s visibility, or the ability to steer or operate other controls.

The total time for inflation and deflation is approximately one-tenth of a second, so fast that most occupants are not aware that the airbags deployed until they see them lying in their laps.

After a crash, you may see what looks like smoke. This is actually powder from the airbag’s surface. Although the powder is not harmful, people with respiratory problems may experience some temporary discomfort. If this occurs, get out of the car as soon as it is safe to do so.
To get the best protection from the side airbags, front seat occupants should wear their seat belts and sit upright and well back in their seats.

If you ever have a moderate to severe side impact, the sensors will detect rapid deceleration and signal the control unit to instantly inflate either the driver’s or the passenger’s side airbag.

Only one airbag will deploy during a side impact. If the impact is on the passenger’s side, the passenger’s side airbag will deploy even if there is no passenger.

To get the best protection from the side airbags, front seat occupants should wear their seat belts and sit upright and well back in their seats.

U.S. Owners:  
For additional information on how your airbags work, see the booklet titled *SRS: What You Need to Know About Airbags* that came with your owner’s manual.

Canadian Owners:  
For additional information on how your airbags work, ask your dealer for a copy of the booklet titled *SRS: What You Need to Know About Airbags*.

Your car is equipped with side airbags for the driver and a front seat passenger. The airbags are stored in the outer edges of the front seat-backs, and both are marked “SIDE AIRBAG.”

**How Your Side Airbags Work**  
*Only on U.S. models equipped with side airbags.*
Additional Information About Your Airbags

How the SRS Indicator Light Works

The SRS indicator light alerts you to a potential problem with your front airbags and automatic seat belt tensioners.

On models with side airbags, this light will also alert you to a potential problem with your side airbags or passenger’s side airbag automatic cutoff system (see page 52).

When you turn the ignition ON (II), this indicator will light briefly then go out. This tells you that the system is working properly.

If the light comes on at any other time, or does not come on at all, you should have the system checked by your dealer. For example:

- If the SRS indicator light does not come on after you turn the ignition ON (II).
- If the light stays on after the engine starts.
- If the light comes on or flashes on and off while you drive.

If you see any of these indications, your front or side airbags may not deploy, your passenger’s side airbag automatic cutoff system may not work properly, or your seat belt tensioners may not work when you need them. See your Honda dealer as soon as possible.

⚠️WARNING

Ignoring the SRS indicator light can result in serious injury or death if the airbags, cutoff system, or tensioners do not work properly.

Have your vehicle checked by a dealer as soon as possible if the SRS light alerts you to a potential problem.
How the Side Airbag Cutoff Indicator Light Works

Only on U.S. models equipped with side airbags

This light alerts you that the passenger's side airbag has been automatically shut off.

If does not mean there is a problem with your side airbags. It means that the side airbag cutoff system has activated to prevent the side airbag from deploying.

To reduce the risk of injury from an inflating side airbag, your car has an automatic cutoff system for the passenger's side airbag.

Although Honda does not encourage children to ride in the front, this system is designed to shut off the side airbag if a child leans sideways and the child's head is in the side airbag deployment path.

If a small-statured adult leans sideways, or larger adult slouches and leans sideways into the deployment path of the side airbag, the system may also shut off the side airbag.

If the side airbag cutoff indicator light comes on, you should have the passenger sit upright. Once the passenger is out of the deployment path of the side airbag, the system will turn the airbag back on and the light will go out.

A front seat passenger should not use a cushion or other object as a backrest. It may prevent the cutoff system from working properly.

When you turn the ignition ON (II), the indicator should light briefly and go out (see page 61). If it doesn't light, stays on, or comes on while driving without a passenger in the front seat, have the system checked.
Additional Information About Your Airbags

Airbag Service
Your front and side airbag systems (if equipped) are virtually maintenance-free, and there are no parts you can safely service. However, you must have your car serviced if:

- **Your airbags ever inflate.** Any airbag that has deployed must be replaced along with the control unit, automatic seat belt tensioners, and other related parts. Do not try to remove or replace any airbag by yourself. This must be done by a Honda dealer or a knowledgeable body shop.

- **The SRS indicator light alerts you to a problem.** Take your car to an authorized Honda dealer as soon as possible. If you ignore this indication, the airbags might not inflate when you need them.

Additional Safety Precautions
- **Do not attempt to deactivate your airbags.** Together, airbags and seat belts provide the best protection.

- **Do not tamper with airbag components or wiring for any reason.** Tampering could cause the airbags to deploy, possibly causing very serious injury.

- **Do not expose the front seat-backs to water.** If rain or spilled water soaks into a seat-back, it can prevent the side airbag system from working properly.

- **Do not cover or replace front seat-back covers without consulting a Honda dealer.** Improperly replacing or covering front seat-back covers can prevent your side airbags from inflating during a collision.

See page 153 for further information and precautions relating to your airbags.
Carbon Monoxide Hazard

Your car's exhaust contains carbon monoxide gas. You should have no problem with carbon monoxide entering the car in normal driving if you maintain your car properly. Have the exhaust system inspected for leaks whenever:

• The car is raised for an oil change.
• You notice a change in the sound of the exhaust.
• The car was in an accident that may have damaged the underside.

**WARNING**

Carbon monoxide gas is toxic. Breathing it can cause unconsciousness and even kill you.

Avoid any enclosed areas or activities that expose you to carbon monoxide.

High levels of carbon monoxide can collect rapidly in enclosed areas, such as a garage. Do not run the engine with the garage door closed. Even with the door open, run the engine only long enough to move the vehicle out of the garage.

With the trunk lid open, air flow can pull exhaust gas into your car's interior and create a hazardous condition. If you must drive with the trunk lid open, open all the windows and set the heating and cooling system as shown below.

If you must sit in your parked car, even in an unconfined area, with the engine running, adjust the heating and cooling system as follows:

1. Select the Fresh Air mode.
2. Select the mode.
3. Turn the fan on high speed.
4. Set the temperature control to a comfortable setting.
These labels are in the locations shown. They warn you of potential hazards that could cause serious injury. Read these labels carefully.

If a label comes off or becomes hard to read, contact your Honda dealer for a replacement.
Safety Labels

HOOD

On models without side airbags

⚠️ WARNING
The airbag inflator is explosive and, if accidentally deployed, can seriously hurt you.
Follow Service Manual instructions carefully.

⚠️ ATTENTION
Le gonfleur SRS est explosif, et s’il se déclenche accidentellement, il risque de provoquer des blessures graves ou de tuer.
Suivez attentivement les instructions du manuel d’entretien.

On models with side airbags

⚠️ WARNING
Accidental deployment can seriously hurt or kill you.
Follow Service Manual instructions carefully.

⚠️ ATTENTION
Un déploiement accidentel risque de causer de graves blessures, voire mort.
Suivez attentivement les instructions du manuel de réparation.
This section gives information about the controls and displays that contribute to the daily operation of your Honda. All the essential controls are within easy reach.
Automatic Transmission (CVT)

* The U.S. instrument panel is shown. Differences for the Canadian models are noted in the text. CONTINUED
The U.S. instrument panel is shown. Differences for the Canadian models are noted in the text.

* The U.S. instrument panel is shown. Differences for the Canadian models are noted in the text.
The instrument panel has many indicators to give you important information about your car.

**Seat Belt Reminder Light**
This indicator lights when you turn the ignition switch ON (II). It is a reminder to you and your passengers to protect yourselves by fastening the seat belts. A beeper also sounds if you have not fastened your seat belt.

If you do not fasten your seat belt, the beeper will stop after a few seconds but the light stays on until you do. Both the light and the beeper stay off if you fasten your seat belt before turning on the ignition.

**Supplemental Restraint System Indicator**
This indicator lights when you turn the ignition switch ON (II). If it comes on at any other time, it indicates a potential problem with your front airbags or automatic seat belt tensioners. On models equipped with side airbags, this light will also alert you to a potential problem with your side airbags or passenger’s side airbag automatic cutoff system. For complete information, see page 51.

**Side Airbag Cutoff Indicator**
*Only on U.S. models equipped with side airbags*
This indicator lights when you turn the ignition switch ON (II). If it comes on at any other time, it indicates that the passenger’s side airbag has automatically shut off. For complete information, see page 52.
This light has two functions:

1. This indicator comes on when you turn the ignition switch ON (II). It is a reminder to check the parking brake. Driving with the parking brake not fully released can damage the brakes and tires.

2. If the indicator remains lit after you have fully released the parking brake while the engine is running, or if it comes on while driving, it can indicate a problem in the brake system. For complete information, see page 275.

This light normally comes on for a few seconds when you turn the ignition switch ON (II), and when the ignition switch is turned to START (III). If this light comes on at any other time, there is a problem in the ABS. If this happens, take the car to your dealer to have it checked. With the light on, your car still has normal braking ability but no anti-lock. For complete information, see page 177.

Parking Brake and Brake System Indicator

If this light comes on when the engine is running, the battery is not being charged. For complete information, see page 272.

Charging System Indicator

The engine can be severely damaged if this light flashes or stays on when the engine is running. For complete information, see page 271.

Low Oil Pressure Indicator

Malfunction Indicator Lamp

See page 273.

See page.

Anti-lock Brake System (ABS) Indicator

Only on models equipped with ABS (see page 175)
**EPS** Electric Power Steering (EPS) Indicator
This light normally comes on when you turn the ignition ON (II) and goes off after the engine starts. If it comes on at any other time, there is a problem in the Electric Power Steering system. If this happens, stop the car in a safe place and turn off the engine. Reset the system by restarting the engine. The indicator will not turn off immediately. If it does not go off after driving a short distance, or comes back on again while driving, take the car to your dealer to have it checked. With the light on, the EPS may be turned off, making the car harder to steer.

**Immobilizer System Indicator**
This indicator comes on for a few seconds when you turn the ignition switch ON (II). It will then go off if you have inserted a properly-coded ignition key. If it is not a properly-coded key, the indicator will blink and the engine will not start (see page 84).

This indicator also blinks several times when you turn the ignition switch from ON (II) to ACCESSORY (I) or LOCK (0).

**IMA** IMA System Indicator
This indicator normally comes on for a few seconds when you turn the ignition switch ON (II). If it comes on at any other time, it indicates a problem in the Integrated Motor Assist (IMA) system. With the IMA indicator on, the vehicle may not accelerate as it normally does. Have the vehicle checked by the dealer as soon as possible.

Auto Idle Stop Indicator
See pages 164 and 172.
Indicator Lights

**Turn Signal and Hazard Warning Indicators**
The left or right turn signal light blinks when you signal a lane change or turn. If the light does not blink or blinks rapidly, it usually means one of the turn signal bulbs is burned out (see page 235). Replace the bulb as soon as possible, since other drivers cannot see that you are signalling.

When you turn on the Hazard Warning switch, both turn signal lights blink. All turn signals on the outside of the car should flash.

**High Beam Indicator**
This light comes on with the high beam headlights. See page 75 for information on the headlight controls.

**“Daytime Running Lights” Indicator**
*Canadian models only*
This indicator lights when you turn the ignition switch to ON (II) with the headlight switch off and the parking brake set. It should go off if you turn on the headlights or release the parking brake. If it comes on at any other time, it means there is a problem with the DRL. There may also be a problem with the high beam headlights.
Cruise Control Indicator
This lights when you set the cruise control. See page 139 for information on operating the cruise control.

Shift Up/Shift Down Indicators
Manual Transmission
See page 165.

Shift Lever Position Indicator
Automatic Transmission (CVT)
See page 166.

Low Fuel Indicator
This light comes on as a reminder that you must refuel soon.

Trunk-open Indicator
This light comes on if the trunk lid is not closed tightly.

Washer Level Indicator
Canadian models only
This light comes on when the washer fluid level is low. Add washer fluid when you see this light come on (see page 205).
Maintenance Required Indicator

This indicator reminds you that it is time to take your car in for scheduled maintenance. Refer to the Maintenance Schedules for Normal and Severe Driving Conditions on pages 184 – 190.

For the first 8,000 miles (12,800 km) after the Maintenance Required Indicator is reset, it will come on for two seconds when you turn the ignition switch ON (II).

Between 8,000 miles (12,800 km) and 10,000 miles (16,000 km) this indicator will light for two seconds when you first turn the ignition switch ON (II), and then flash for ten seconds.

If you exceed 10,000 miles (16,000 km) without having the scheduled maintenance performed, this indicator will remain on as a constant reminder.

Your dealer will reset this indicator after completing the scheduled maintenance. If this maintenance is done by someone other than your Honda dealer, reset the indicator as follows.

1. Turn off the engine.

2. Press and hold the select/reset button in the instrument panel, then turn the ignition switch ON (II).

3. Hold the button until the indicator resets (approximately ten seconds).
U.S. model is shown.
Gauges

Manual Transmission

- SPEEDOMETER
- TACHOMETER
- ODOMETER/TRIP METER
- FUEL METER
- IMA CHARGE/ASSIST GAUGE
- BATTERY LEVEL INDICATOR
- FUEL MILEAGE DISPLAY
- SELECT/RESET BUTTON
- TEMPERATURE GAUGE
- CURRENT FUEL MILEAGE DISPLAY

U.S. model is shown.
The gauges illuminate when you turn the ignition switch ON (II).

**Speedometer**  
*U.S. Models*  
This shows your speed in miles per hour (mph). The smaller inner numbers are the speed in kilometers per hour (km/h).

*Canadian Models*  
This shows your speed in kilometers per hour (km/h). The smaller inner numbers are the speed in miles per hour (mph).

**Tachometer**  
The tachometer shows the engine speed in revolutions per minute (rpm). To protect the engine from damage, never drive with the tachometer reading in the red zone.

**Odometer/Trip Meter**  
The odometer shows the total distance your car has been driven. It measures miles in U.S. models and kilometers in Canadian models. It is illegal under U.S. federal law and Canadian provincial regulations to disconnect, reset, or alter the odometer with the intent to change the number of miles or kilometers indicated.

The trip meter shows the number of miles (U.S.) or kilometers (Canada) driven since you last reset it.
There are two trip meters: Trip A and Trip B. The odometer and the two trip meters use the same display. Switch between these displays and the odometer by pressing the Select/Reset button repeatedly. Each trip meter works independently, so you can keep track of two different distances.

To reset a trip meter, display it, and then press and hold the Select/Reset button until the number resets to “0.0”.

This display shows the current, or instantaneous fuel mileage you are getting.

It shows the number of miles per hour and mpg (U.S.) or kilometers per hour and 1/100 km (Canada).

You can turn off this display at any time. See page 71.

When a trip meter is displayed, the average fuel mileage you have been getting during that trip is shown in the Fuel Mileage display. This number is updated once per ten seconds.

When you reset a trip meter, the average fuel mileage for that trip meter also resets.
Turning Off the Mileage Display
You can temporarily turn off the Current Fuel Mileage display.

To turn it off:

1. Turn the ignition switch to ON (II). If the engine is running, make sure the transmission is in Neutral (manual) or Park (automatic) and the parking brake is set.

2. Use the Select/Reset button to select the odometer display.

3. Press and hold the Select/Reset button for about 10 to 15 seconds, then release it. The Current Fuel Mileage display will turn off.

The display will turn back on when you repeat the same procedure on the step 3.

Fuel Gauge
This shows how much fuel you have. It is most accurate when the car is on level ground. It may show slightly more or less than the actual amount when you are driving on curvy or hilly roads.

**NOTICE**

*Avoid driving with an extremely low fuel level. Running out of fuel could cause the engine to misfire, damaging the catalytic converter.*

Temperature Gauge
This shows the temperature of the engine’s coolant. During normal operation, the reading should be in the middle of the gauge. In severe driving conditions, such as very hot weather or a long period of uphill driving, the reading may reach near the red mark. If it reaches the red (Hot) mark, pull safely to the side of the road. Turn to page 268 for instructions and precautions on checking the engine’s cooling system.

Avoid driving with an extremely low fuel level. Running out of fuel could cause the engine to misfire, damaging the catalytic converter.
This gauge shows you the state of charge of the battery for the Integrated Motor Assist (IMA). This battery is recharged by the engine, and discharged by the IMA when it is assisting the engine with powering the vehicle.

The gauge reading may drop near the bottom under driving conditions that require assist for a long time, such as prolonged acceleration or climbing a long hill. The engine will recharge the battery as you continue driving.

If the battery is mostly discharged, the Auto Idle Stop function is disabled (see pages 163 and 171).

The battery level gauge does not read the battery level directly. It calculates the level by continuously measuring the current flow, voltage, and temperature.

Since the level is not read directly, small sensing errors can, over time, cause the gauge to read higher than the actual battery level. The system will then perform a correction, and the battery level gauge reading will drop suddenly. When this happens, IMA assist and Auto Idle Stop are disabled until the IMA battery is sufficiently recharged by normal driving. This should take only a few minutes.

This correction of the battery level gauge is normal and does not indicate a problem. If the IMA battery develops a problem or becomes deteriorated, the IMA system indicator will come on. If this happens, have the vehicle checked by your dealer as soon as possible.
This gauge shows you the status of the Integrated Motor Assist (IMA). When the IMA battery is being charged, the left side of the gauge illuminates. When the IMA is assisting the engine, the right side of the gauge illuminates.

If the IMA battery is too hot or too cold, the IMA system shuts down to protect the battery. This disables the IMA assist and Auto Idle Stop, even though the Battery Level Gauge may show that the battery is well-charged. Therefore, those functions may not operate when you first start driving in very hot or cold weather.

The battery temperature will normalize after a few minutes of driving, and the IMA system will work normally.
The two levers on the steering column contain controls for driving features you use most often. The left lever controls the turn signals, headlights, and high beams. The right lever controls the windshield washers and wipers.

The hazard warning lights switch is on the dashboard between the center air vents.

The controls under the left air vent are for the rear window defogger, mirrors, and cruise control.

The tilt adjustment lever on the underside of the steering column allows you to tilt the steering wheel.

* To use the horn, press the center pad of the steering wheel.
If you leave the lights on with the ignition switch in ACCESSORY (I) or LOCK (0), you will hear a reminder tone when you open the driver’s door.

The rotating switch on the left lever controls the lights. Turning this switch to the “ ” position turns on the parking lights, taillights, side-marker lights, and rear license plate lights. Turning the switch to the “ ” position turns on the headlights.

To change from low beams to high beams, push the turn signal lever forward until you hear a click. The blue high beam indicator will light (see page 64). To return to low beams, pull the turn signal lever back.
To flash the high beams, pull the turn signal lever back lightly, then release it. The high beams will come on and go off. The high beams will stay on for as long as you hold the lever back, no matter what position the headlight switch is in.

**Daytime Running Lights**

*Canadian models only*

With the headlight switch off, the high beam headlights come on with reduced brightness when you turn the ignition switch to ON (II) and release the parking brake. They remain on until you turn the ignition off, even if you set the parking brake.

The headlights revert to normal operation when you turn them on with the switch.
Turn the Select/Reset knob on the right side of the instrument panel to adjust the brightness of the instrument panel lights.

Turn the Select/Reset knob to adjust the instrument panel brightness. There are six brightness levels. When you turn the knob, the odometer/trip meter display changes to circles that show you the current level. You will hear a tone when you reach the maximum or minimum brightness. The display returns to the odometer/trip meter values five seconds after you stop adjusting the knob.

The instrument panel dims when the parking lights or headlights are turned on. Adjust the brightness to the desired level with the headlight switch off, and also with the headlight switch on. Both settings will remain at those levels until you change them.

To reduce glare at night, the instrument panel illumination dims when you turn the light switch to ☀ or ☽. Turning the Select/Reset knob fully to the right will return the instrument panel to the brightness adjusted with the headlight switch off and a tone will sound.
**Turn Signals**

Signal a turn or lane change with this lever. Push down on the lever to signal a left turn, and up to signal a right turn. If you push it up or down all the way, the turn signal continues to blink even when you release the lever. It shuts off automatically as you complete the turn.

To signal a lane change, push lightly on the turn signal lever in the proper direction and hold it. The lever will return to the center position as soon as you release it.

**Windshield Wipers**

This lever controls the windshield wipers and washers. It has five positions:
- MIST: mist
- OFF: off
- INT: intermittent
- LO: low speed
- HI: high speed

To select a position, push the lever up or down.
In intermittent, the wipers operate every few seconds. You can vary how often the wipers sweep the windshield by turning the INT TIME ring on the right lever. In low speed and high speed, the wipers run continuously.

**INT TIME RING**

To operate the wipers in mist mode, push the control lever up from the OFF position. The wipers run at high speed until you release the lever. This gives you a quick way to clear the windshield.

**To operate the wipers in mist mode,**

**push the control lever up from the OFF position.**

**The wipers run at high speed until you release the lever.**

**This gives you a quick way to clear the windshield.**
To clean the windshield, pull back on the wiper control lever. The washers spray until you release the lever.

The wipers run at low speed while you're pulling the lever, then complete one more sweep of the windshield after you release it.

Push the button between the center vents to turn on the hazard warning lights (four-way flashers). This causes all four outside turn signals and both indicators in the instrument panel to flash. Use the hazard warning lights if you need to park in a dangerous area near heavy traffic, or if your car is disabled.
The rear window defogger will clear fog, frost, and thin ice from the window. Push the defogger button to turn it on and off. The light in the button lights to show the defogger is on. If you do not turn it off, the defogger will shut itself off after about 15 minutes. It also shuts off when you turn off the ignition. You have to turn it on again when you restart the car.

Make sure the rear window is clear and you have good visibility before starting to drive.

The defogger wires on the inside of the rear window can be accidentally damaged. When cleaning the glass, always wipe side to side.
Steering Wheel Adjustment
See page 18 for important safety information about how to properly position the steering wheel.

Make any steering wheel adjustment before you start driving.

WARNING
Adjusting the steering wheel position while driving may cause you to lose control of the car and be seriously injured in a crash.

Adjust the steering wheel only when the car is stopped.

To adjust the steering wheel upward or downward:

1. Push the lever under the steering column all the way down.

2. Move the steering wheel to the desired position, making sure the wheel points toward your chest, not toward your face. Make sure you can see the instrument panel gauges and the indicator lights.

3. Push the lever up to lock the steering wheel in that position.

4. Make sure you have securely locked the steering wheel in place by trying to move it up and down.
Your car comes with two master keys and a valet key. The master key fits all the locks on your car:
- Ignition
- Doors
- Trunk
- Trunk release handle

The valet key works only in the ignition and the door locks. You can keep the trunk, and trunk release handle locked when you leave your car and the valet key at a parking facility. (See Trunk, page 92.)

You should have received a key number plate with your set of keys. You will need this key number if you ever have to get a lost key replaced. Keep the plate stored in a safe place. When replacing keys, use only Honda-approved key blanks.

These keys contain electronic circuits that are activated by the Immobilizer System. They will not work to start the engine if the circuits are damaged.

- Protect the keys from direct sunlight, high temperature, and high humidity.
- Do not drop the keys or set heavy objects on them.
- Keep the keys away from liquids. If they get wet, dry them immediately with a soft cloth.

The keys do not contain batteries. Do not try to take them apart.

CONTINUED
Immobilizer System
The Immobilizer System protects your car from theft. A properly-coded master or valet key must be used in the ignition switch for the engine to start. If an improperly-coded key (or other device) is used, the engine’s fuel system is disabled.

When you turn the ignition switch to ON (II), the Immobilizer System indicator should come on for a few seconds, then go out. If the indicator starts to blink, it means the system does not recognize the coding of the key. Turn the ignition switch to LOCK (0), remove the key, reinsert it, and turn the switch to ON (II) again.

The system may not recognize your key’s coding if another immobilizer key or other metal object is near the ignition switch when you insert the key. To make sure the system recognizes the key code:

- Do not keep other immobilizer keys on the same key ring.
- Use a plastic or leather key fob, not metal.
- Keep other keys away from your car’s key and the ignition switch while trying to start the engine.

If the system repeatedly does not recognize the coding of your key, contact your Honda dealer.

Remote Transmitter
Your car also comes with two remote transmitters; see page 89 for an explanation of the operation.
The Immobilizer System indicator will also blink several times when you turn the ignition switch from ON (II) to ACCESSORY (I) or LOCK (0).

Do not attempt to alter this system or add other devices to it. Electrical problems could result that may make your car undriveable.

If you have lost your key and you cannot start the engine, contact your Honda dealer.

As required by the FCC:
This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

This device complies with Industry Canada Standard RSS-210. Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference that may cause undesired operation of the device.
Ignition Switch

The ignition switch is on the right side of the steering column. It has four positions:
• LOCK (0)
• ACCESSORY (I)
• ON (II)
• START (III)

LOCK (0) — You can insert or remove the key only in this position. To switch from ACCESSORY to LOCK, you must push the key in slightly as you turn it. If your car has an automatic transmission, the shift lever must also be in Park. The anti-theft lock will lock the steering column when you remove the key.

If the front wheels are turned, the anti-theft lock may sometimes make it difficult to turn the key from LOCK to ACCESSORY. Firmly turn the steering wheel to the left or to the right as you turn the key.

**WARNING**

Removing the key from the ignition switch while driving locks the steering. This can cause you to lose control.

Remove the key from the ignition switch only when parked.
ACCESSORY (I) — In this position, you can operate the audio system and the accessory power socket.

ON (II) — This is the normal key position when driving. All features and accessories on the car are usable. Several of the lights on the instrument panel come on as a test when you turn the ignition switch from ACCESSORY to ON.

START (III) — Use this position only to start the engine. The switch returns to ON (II) when you let go of the key.

The engine will not start if the Immobilizer System does not recognize the key’s coding (see page 84).

You will hear a reminder beeper if you leave the key in the ignition switch in the LOCK (0) or ACCESSORY (I) position and open the driver’s door. Remove the key to turn off the beeper.

Power Door Locks

The master door lock switch allows control of all door locks from the driver’s door. Push the switch down to lock all doors, and up to unlock them.

CONTINUED
To lock any passenger’s door when getting out of the car, push the lock tab down and close the door. To lock the driver’s door, remove the key from the ignition switch, pull the outside door handle and push the lock tab down or push the master switch down. Release the handle, then close the door.

All doors lock when you push down the lock tab on the driver’s door, or lock the driver’s door from the outside with the key. Only the driver’s door unlocks when you use the key or the lock tab. To unlock the passengers’ doors, use the master door lock switch or the lock tab on each door.

Each door has a lock tab at the top of the door. When you push down the lock tab on the driver’s door, all doors lock. Pulling up the lock tab on the driver’s door only unlocks that door. The lock tab on each passenger’s door only locks and unlocks that door.

The front doors can be locked and unlocked from the outside with the key.
When you push the LOCK button a second time within 5 seconds after you have locked the doors, the horn will sound once to verify that the doors are locked.

When you push the UNLOCK button once, only the driver’s door unlocks. The remaining doors unlock when you push the button a second time. The parking lights, side marker lights, taillights, license plate lights, and the instrument panel lights flash twice each time you push the button.

The ceiling light (if the ceiling light switch is in the center position) will come on when you press the UNLOCK button. If you do not open any of the doors, the light will go out in about 30 seconds and the doors will automatically relock. If you relock the doors with the remote transmitter before 30 seconds have elapsed, the light will go off immediately.

You cannot lock the doors with the remote transmitter if any door is not fully closed. You cannot lock or unlock the doors with the key in the ignition switch.

CONTINUED
Panic Mode
Panic mode allows you to remotely activate your car’s horn and exterior lights to attract attention. When activated, the horn will sound, and the exterior lights will flash, for about 30 seconds. To activate panic mode, press and hold the PANIC button for about one second.

To cancel Panic mode before 30 seconds, press any button on the remote transmitter. You can also turn the ignition switch to ON (II).

Panic mode will not activate if the ignition switch is in the ON (II) position.

Replacing the Battery
When the remote transmitter’s battery begins to get weak, it may take several pushes on the button to lock or unlock the doors, and the LED will get dim. Replace the battery as soon as possible.

Battery type: CR2025

To replace the battery, remove the round cover on the back of the transmitter by turning it counterclockwise with a coin.

Remove the old battery and note the polarity. Make sure the polarity of the new battery is the same (+ side facing up), then insert it in the transmitter.
Reinstall the cushion ring. Align the ▼ mark on the cover with the ◊ mark on the transmitter, then set the cover in place and turn it clockwise.

### Transmitter Care
Avoid severe shock to the transmitter, such as dropping or throwing it. Also, protect it from extreme hot or cold temperatures.

Clean the transmitter case with a soft cloth. Do not use strong cleaners or solvents that could harm the case. Immersing the transmitter in any liquid will harm the transmitter and cause it to not function properly.

If you lose a transmitter, you will need to have the replacement programmed to your car’s system by your Honda dealer. Any other transmitters you have will also need to be reprogrammed.

As required by the FCC:
This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Changes or modifications not expressly approved by the party responsible for compliance could void the user’s authority to operate the equipment.

This device complies with Industry Canada Standard RSS-210. Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference that may cause undesired operation of the device.
Childproof Door Locks

The childproof door locks are designed to prevent children seated in the rear from accidentally opening the rear doors. Each rear door has a lock lever near the edge. With the lever in the LOCK position, the door cannot be opened from the inside regardless of the position of the lock tab. To open the door, pull the lock tab up and use the outside door handle.

Trunk

You can open the trunk in two ways:

- Pull the trunk release handle to the left of the driver's seat.
- Use the master key to open the trunk lock. The valet key does not work in this lock.

To close the trunk, press down on the trunk lid.

See page 154 for cargo loading and weight limit information. Keep the trunk lid closed at all times while driving to avoid damaging the lid, and to prevent exhaust gas from getting into the interior. See Carbon Monoxide Hazard on page 54.
To protect items in the trunk when you need to give the key to someone else, lock the trunk release handle with the master key and give the other person the valet key.

As a safety feature, your car has a release lever on the trunk latch so the trunk can be opened from the inside.

To open the trunk, push the release lever to the left.

Parents should decide if their children should be shown how to use this feature.

For more information about child safety, see page 26.
Front Seat Adjustments
See pages 13 – 15 for important safety information and warnings about how to properly position seats and seat-backs.

Make all seat adjustments before you start driving.

To adjust the seat forward and backward, pull up on the bar under the seat cushion’s front edge. Move the seat to the desired position and release the bar. Try to move the seat to make sure it is locked in position.

To change the angle of the seat-back, pull up on the lever on the outside of the seat bottom. Move the seat-back to the desired position and release the lever. Let the seat-back latch into the new position.
Driver’s Seat Armrest

To use the driver’s seat armrest, pivot it down.
Head Restraints
See page 16 for important safety information and a warning about how to properly position the head restraints.

The front head restraints help protect you and your passenger from whiplash and other injuries. They are most effective when you adjust them so the back of the occupant's head rests against the center of the restraint. A taller person should adjust the restraint as high as possible.

To remove a head restraint for cleaning or repair, pull it up as far as it will go. Push the release button and pull the restraint out of the seatback.

The front head restraints adjust for height. You need both hands to adjust the restraint. Do not attempt to adjust it while driving. To raise it, pull upward. To lower the restraint, push the release button sideways and push the restraint down.
The driver’s door armrest has a master power window control panel. To open any of the passenger’s windows, push down on the appropriate switch and hold it until the window reaches the desired position. To close the window, pull back on the window switch. Release the switch when the window gets to the position you want.

**WARNING**

Closing a power window on someone’s hands or fingers can cause serious injury.

Make sure your passengers are away from the windows before closing them.
The master control panel also contains these extra features:

**AUTO** — To open the driver’s window fully, push the window switch firmly down and release it. The window automatically goes all the way down. To stop the window from going all the way down, pull back on the window switch briefly.

To open the driver’s window only partially, push the window switch down lightly and hold it. The window will stop as soon as you release the switch.

The AUTO function only works to lower the driver’s window. To raise the window, you must pull back on the window switch and hold it until the window reaches the desired position.

The light inside the AUTO switch comes on when you turn the ignition switch to ON (II).

The MAIN switch controls power to the passengers’ windows. When you push in the MAIN switch, the passengers’ windows cannot be raised or lowered. The MAIN switch does not affect the driver’s window. To cancel this feature, push on the switch again to get it to pop out. Keep the MAIN switch pushed in when you have children in the car so they do not injure themselves by operating the windows unintentionally.
Keep the inside and outside mirrors clean and adjusted for best visibility. Be sure to adjust the mirrors before you start driving.

The inside mirror has day and night positions. The night position reduces glare from headlights behind you. Flip the tab on the bottom edge of the mirror to select the day or night position.

Adjust the outside mirrors with the adjustment switch on the left side of the dashboard:

1. Turn the ignition switch ON (II).
2. Move the selector switch to L (driver’s side) or R (passenger’s side).

3. Push the appropriate edge of the adjustment switch to move the mirror right, left, up, or down.
4. When you finish, move the selector switch to the center (off) position. This turns off the adjustment switch so you can’t move a mirror out of position by accidentally bumping the switch.

CONTINUED
To apply the parking brake, pull the lever up fully. To release it, pull up slightly, push the button, and lower the lever. The parking brake light on the instrument panel should go out when the parking brake is fully released (see page 62).

On Canadian model
The outside mirrors are heated to remove fog and frost. With the ignition switch ON (I), turn on the heaters by pressing the button. The light in the button comes on as a reminder. Press the button again to turn the heaters off.

Driving the car with the parking brake applied can damage the rear brakes and axles.
Open the glove box by squeezing the handle. Close it with a firm push.

**WARNING**

An open glove box can cause serious injury to your passenger in a crash, even if the passenger is wearing the seat belt.

Always keep the glove box closed while driving.
To open the beverage holder, push on the top. The beverage holder lid is spring-loaded and will swing open. To close it, push it down until it latches.

Be careful when you are using the beverage holder. A spilled liquid that is very hot can scald you or your passengers. Spilled liquids can also damage the upholstery, carpeting, and electrical components in the interior.

Squeeze the handle and slide the console compartment lid backward to access the compartment.
Coin Box

The coin box is located under the air vent. To open the coin box, pull down the lid. Close it with a firm push.

Center Pocket

The center pocket is located under the audio system. To open the lid, pull it down. Close it with a firm push.

Accessory Power Socket

To use the accessory power socket, pull up the cover.

This socket is intended to supply power for 12 volt DC accessories that are rated 120 watts or less (10 amps). To power an accessory, the ignition switch must be in ACCESSORY (I) or ON (II).

It will not power an automotive type cigarette lighter element.
The ceiling light has a three-position switch. In the OFF position, the light does not come on. In the center position, the ceiling light comes on when you open any door. In the ON position, the ceiling light stays on continuously.

The ceiling light (with the switch in the center position) comes on when you remove the key from the ignition switch. If you do not open a door, the light stays on, then fades out in about 10 seconds.

The ceiling light (with the switch in the center position) also comes on when you unlock the door with the key, the lock tab on the driver's door, the master door lock switch, or the remote transmitter (see page 89).

If you leave any door open with the key not in the ignition switch, the ceiling light will go off after three minutes.

Turn on the spotlight by pushing the lens. Push the lens again to turn it off. You can use the spotlights at all times.
Your car also has a courtesy light in the ignition switch. This light comes on when you unlock the driver's door or remove the key from the ignition switch. It fades out about six seconds after the door is closed.
The heating and air conditioning systems in your Honda provide a comfortable driving environment in all weather conditions.

The standard audio system has many features. This section describes those features and how to use them. (If you selected an optional audio system, refer to the operating instructions that came with it.)

Your Honda has an anti-theft audio system that requires a code number to enable it.
The heating and cooling system in your Honda has full heating, ventilation, and air conditioning capabilities. In combination with the air conditioning, the system regulates the interior temperature you select. The system also adjusts the fan speed and air flow direction automatically depending on the set temperature.

The direction of air flow from the vents in the center and each side of the dashboard is adjustable.

To adjust the air flow from each vent, move the vent up-and-down and move the tab side-to-side.

The side vents can be opened and closed with the dials underneath them.
The heating and cooling system draws air through the exterior vents at the bottom of the windshield. Keep these vents clear of leaves and other debris.

The engine must be running for the heater and air conditioning to generate hot and cold air. The heater uses engine coolant to warm the air. If the engine is cold, it will be several minutes before you feel warm air coming from the system.

Ventilation
Your car has a flow-through ventilation system. Air enters the car through vents in front of the windshield. It circulates through the interior then exits through vents near the rear window. This system provides fresh air even when the car is standing still. To bring in outside air, select the Fresh Air mode. Set the fan at a comfortable speed.
**Automatic Operation**
To use the heating and cooling system in automatic mode, set the system as follows.

1. Set the fan control dial to AUTO.
2. Set the mode control dial to AUTO.
3. Set the desired temperature by turning the temperature control dial. Turning this dial clockwise increases the temperature of the air flow.
4. Select Fresh Air mode. The indicator in the button should be off.
5. Turn on the A/C by pressing the button for cooling and dehumidifying. The indicator in the button lights.
To heat or cool the interior faster, select Recirculation mode and set the temperature control dial to the upper or lower limit. The system runs of full cooling or heating only. It does not regulate the interior temperature. When the temperature is set between the lower and upper limits, the system regulates the interior temperature to the set value.

Turning the fan control dial to OFF shuts the heating and cooling system completely off. Keep the system completely off only for short periods. To keep stale air and mustiness from collecting, you should have the fan running at all times.

When the system is in full AUTO mode, the Auto Idle Stop function will not be activated.

**Manual Operation**

You can manually set the system controls for ventilation, air conditioning, heating, air flow direction, and fan speed in various combinations.

**ECON Button**

When you press the ECON button with the fan speed control dial on, the Auto Idle Stop works only if the outside temperature is above 41°F (5°C). The indicator in the button lights when the ECON is on. With the ECON on, you can get better fuel economy. You can select the ECON mode with the A/C on or off.

In this mode with A/C on, you may feel a slight reduction in cooling efficiency. If you want more cooling, select AUTO (see page 110).

The system turns off the ECON mode when you select AUTO, 🌡️, or ⚡️.

**Air Conditioning (A/C) Button**

Pressing the A/C button turns the air conditioning ON and OFF. The indicator in the button lights when the A/C is ON.

When you turn the A/C off, the system cannot regulate the inside temperature if you set the dial below the outside air temperature. With A/C on, use the temperature control dial to adjust the temperature of the air flow to a comfortable setting.
Air conditioning also removes moisture from the air as it operates. You can use it to defog the windows quickly in cool or damp weather. Used in combination with the heater, it also makes the interior warm and dry.

Air conditioning places an extra load on the engine. Watch the engine coolant temperature gauge (see page 71) when using the A/C in heavy traffic or driving up long hills. If the reading reaches near the red mark, turn off the air conditioning until the gauge reads normally.
Recirculation Button
This button controls the source of the air going into the system. When the indicator in this button is lit, air from the car’s interior is sent through the system again (Recirculation mode). When the indicator is off, air is brought in from outside the car (Fresh Air mode).

Use Recirculation mode to heat or cool the interior more quickly, or to keep out smoke and dust. Leaving the system in the Recirculation mode with the A/C off can cause the windows to fog up. Switch to Fresh Air mode as soon as the interior reaches a comfortable temperature or the outside smoky, dusty condition clears.

Fan Speed
You can manually select the fan speed by turning the fan speed control dial. Turning this dial clockwise increases the fan speed, which increases air flow.

When the dial is set to AUTO, the system controls the fan speed automatically.

When the fan speed control dial is off, the Auto Idle Stop works under certain conditions (see pages 163 and 171).

Mode Control Dial
Use the MODE control dial to select the vents the air flows from. Some air will flow from the dashboard corner vents in all modes.

In AUTO mode, the system controls the air flow direction automatically between the dashboard vents and the floor vents.
The main air flow comes out of the dashboard vents.

The main air flow is divided between the dashboard vents and the floor vents.
The main air flow comes from the floor vents. When you select , the system automatically switches to Fresh Air mode.

The main air flow is divided between the floor vents and defroster vents at the base of the windshield. When you select , the system automatically switches to Fresh Air mode, turns on the A/C, and turns off the ECON mode.
The  ⬆️ directs the main air flow to the windshield for faster defrosting or defogging. It also overrides any MODE selection you may have made. When you select  ⬆️, the A/C turns on automatically and the system selects Fresh Air mode and turns off the ECON mode. To defrost or defog more quickly, turn the temperature control dial to 82°F ~ 86°F (28°C ~ 30°C). Select  ⬆️ and set the fan speed to high. To turn off defrost or defog, turn the mode control dial to another mode. When you switch to another mode from  ⬆️, the A/C stays on. Press the A/C button to turn it off.

If there is actual frost on the windows, first select the Recirculation mode. If the windows are fogged, select the Fresh Air mode. Warmed air will then flow from the windshield and side defroster vents.
When you select  or  , the Auto Idle Stop function will not activate.

Sunlight Sensor/Temperature Sensor

To regulate the interior temperature, the system has two sensors. A sunlight sensor is located in the top of the dashboard and a temperature sensor is next to the steering column. Do not cover the sensors or spill any liquid on them.
Audio System

AM/FM/CD Audio System
Your Honda’s audio system provides clear reception on both AM and FM bands, while the preset buttons allow you to easily select your favorite stations.

The anti-theft feature will disable the system if it is disconnected from the car’s battery. To get the system working again, you must enter a code number (see page 137).

Operating the Radio
The ignition switch must be in ACCESSORY (I) or ON (II) to operate the audio system. Turn the system on by pushing the PWR/VOL knob or the AM/FM button. Adjust the volume by turning the PWR/VOL knob.

The band and frequency that the radio was last tuned to is displayed. To change bands, press the AM/FM button. On the FM band, ST will be displayed if the station is broadcasting in stereo. Stereo reproduction on AM is not available.
You can use any of five methods to find radio stations on the selected band: TUNE, SEEK, SCAN, AUTO SELECT, and the Preset buttons.

**TUNE** — Use the TUNE knob to tune the radio to a desired frequency. Turn the TUNE knob to the right to tune to a higher frequency, or to the left to tune to a lower frequency. Turn the knob right or left until the display reaches the desired frequency.

**SEEK** — The SEEK function searches the band for a station with a strong signal. To activate it, press the SEEK bar on either the ◀◀ or ▶▶ side, then release it. Depending on which side you press, the system scans upward or downward from the current frequency. It stops when it finds a station with a strong signal.

**SCAN** — The SCAN function samples all the stations with strong signals on the selected band. To activate it, press the SCAN button, then release it. You will see SCAN in the display. The system will scan up the band for a station with a strong signal. When it finds one, it will stop and play that station for approximately five seconds. If you do nothing, the system will then scan for the next strong station and play that for five seconds. When it plays a station that you want to continue listening to, press the SCAN button again.

CONTINUED
Preset — You can store the frequencies of your favorite radio stations in the six preset buttons. Each button will store one frequency on the AM band, and two frequencies on the FM band.

To store a frequency:

1. Select the desired band, AM or FM. FM1 and FM2 let you store two frequencies with each Preset button.
2. Use the TUNE, SEEK, or SCAN function to tune the radio to a desired station.
3. Pick the Preset button you want for that station. Press the button and hold it until you hear a beep.
4. Repeat steps 1 to 3 to store a total of six stations on AM and twelve on FM.

Once a station’s frequency is stored, simply press and release the proper preset button to tune to it.

The preset frequencies will be lost if your car’s battery goes dead, is disconnected, or the radio fuse is removed.
AUTO SELECT — If you are traveling far from home and can no longer receive the stations you preset, you can use the Auto Select feature to find stations in the local area.

To activate Auto Select, press the A. SEL button. A. SEL will flash in the display, and the system will go into scan mode for several seconds. It automatically scans both bands, looking for stations with strong signals. It stores the frequencies of six AM stations and twelve FM stations in the preset buttons. You can then use the preset buttons to select those stations.

If you are in a remote area, Auto Select may not find six strong AM stations or twelve strong FM stations. If this happens, you will see a “0” displayed when you press any preset button that does not have a station stored.

If you do not like the stations Auto Select has stored, you can store other frequencies in the preset buttons. Use the TUNE, SEEK, or SCAN function to find the desired frequencies, then store them in the selected preset buttons as described previously.

Auto Select does not erase the frequencies that you preset previously. When you return home, turn off Auto Select by pressing the A. SEL button. The preset buttons will then select the frequencies you originally set.
Adjusting the Sound

Bass, Treble, Balance, and Fader are each adjustable. You select which of these you want to adjust by pressing the TUNE knob. The mode changes from BAS to TRE to FAd to BAL, and then back to the selected audio mode, each time you press the TUNE knob. Each mode is shown in the display as it changes.

Balance/Fader — These two modes adjust the strength of the sound coming from each speaker. BAL adjusts the side-to-side strength, while FAD adjusts the front-to-back strength.

Select BAL or FAd by pressing the TUNE knob. Adjust the Balance or Fader to your liking by turning the TUNE knob. The displayed number shows you the current setting. When the adjustment level reaches the center, you will see “ ”.

Treble/Bass — Use these modes to adjust the tone to your liking. Select TRE or BAS by pressing the TUNE knob. Adjust the desired mode by turning the TUNE knob. The displayed number shows you the current setting. When the adjustment level reaches the center, you will see “ ”.

The system will automatically return the display to the selected audio mode about five seconds after you stop adjusting a mode with the TUNE knob.
**Audio System Lighting**
You can use the instrument panel brightness control knob to adjust the illumination of the audio system (see page 77). The audio system illuminates when the parking lights are on, even if the radio is turned off.

**Digital Clock**
The display of your audio system usually shows the time when the ignition switch is in ACCESSORY (I) or ON (II). It shows the operation mode of the radio, CD player, or optional CD changer/cassette player when you operate them, and goes back to the time display after five seconds.

If an error occurs while operating the CD player or optional CD changer, the display will show the error code and will not switch to the time display until the error is corrected (see pages 131 and 132).

---

You can set the time only when the clock is displayed.

To set the hours, press the H (Preset 4) button while pressing the CLOCK (SCAN/RPT) button. Press and hold the H button until the hour advances to the desired time.

To set the minutes, press the M (Preset 5) button while pressing the CLOCK (SCAN/RPT) button. Press and hold the M button until the minutes numbers advance to the desired time.
You can quickly set the time to the nearest hour. If the displayed time is before the half hour, the clock is set back to the previous hour by pressing and holding the CLOCK (SCAN/RPT) button, then pressing the R (Preset 6) button. If the displayed time is after the half hour, the clock is set forward to the beginning of the next hour.

For example:
• 1:06 would RESET to 1:00.
• 1:52 would RESET to 2:00.

If your car’s battery is disconnected or goes dead, the time setting will be lost. To set the time again, follow the setting procedure.

**Radio Frequencies**

Your Honda’s radio can receive the complete AM and FM bands. Those bands cover these frequencies:

- **AM band:**
  - 530 to 1,710 kilohertz
- **FM band:**
  - 87.7 to 107.9 megahertz

Radio stations on the AM band are assigned frequencies at least ten kilohertz apart (530, 540, 550).

Radio stations on the FM band are assigned frequencies at least 0.2 megahertz apart (87.9, 88.1, 88.3).

Stations must use these exact frequencies. It is fairly common for stations to round-off the frequency in their advertising, so your radio could display a frequency of 100.9 even though the announcer may identify the station as “FM101.”
Radio Reception
How well your Honda’s radio receives stations is dependent on many factors, such as the distance from the station’s transmitter, nearby large objects, and atmospheric conditions.

A radio station’s signal gets weaker as you get farther away from its transmitter. If you are listening to an AM station, you will notice the sound volume becoming weaker, and the station drifting in and out. If you are listening to an FM station, you will see the stereo indicator flickering off and on as the signal weakens. Eventually, the stereo indicator will go off and the sound will fade completely as you get out of range of the station’s signal.

Driving very near the transmitter of a station that is broadcasting on a frequency close to the frequency of the station you are listening to can also affect your radio’s reception. You may temporarily hear both stations, or hear only the station you are close to.

CONTINUED
Radio signals, especially on the FM band, are deflected by large objects such as buildings and hills. Your radio then receives both the direct signal from the station’s transmitter, and the deflected signal. This causes the sound to distort or flutter. This is a main cause of poor radio reception in city driving.

Radio reception can be affected by atmospheric conditions such as thunderstorms, high humidity, and even sunspots. You may be able to receive a distant radio station one day and not receive it the next day because of a change in conditions.

Electrical interference from passing vehicles and stationary sources can cause temporary reception problems.

As required by the FCC:
Changes or modifications not expressly approved by the party responsible for compliance could void the user’s authority to operate the equipment.
Operating the CD Player
You operate the CD player with the same controls used for the radio.

With the ignition switch in ACCESSORY (I) or ON (II), insert the disc into the CD slot. Push the disc in halfway, the drive will pull it in the rest of the way and begin to play. The number of the track that is playing is shown in the display.

You can also play 3-inch (8-cm) discs without using an adapter ring. Play only standard round discs. Odd-shaped CDs may jam in the drive or cause other problems.

For best results when using CD-R discs, use only high quality discs labeled for audio use. When recording a CD-R, the recording must be closed in order for the disc to be used by CD players. CD-RW discs will not work in this unit.
When the system reaches the end of the disc, it will return to the beginning and play that disc again.

You can use the SEEK/SKIP bar while a disc is playing to select passages and change tracks.

To move rapidly within a track, press and hold the SEEK/SKIP bar. Press the ▶▶ side to move forward. You will see CUE in the display. Press the ▼▼ side to move backward. You will see REW displayed. Release the bar when the system reaches the point you want.

To activate the Repeat feature, press and release the RPT button. You will see RPT in the display. The system continuously replays the current track. Press the RPT button again to turn it off.

REPEAT — To activate the Repeat feature, press and release the RPT button. You will see RPT in the display. The system continuously replays the current track. Press the RPT button again to turn it off.

RANDOM PLAY — This feature, when activated, plays the tracks on the CD in random order, rather than in the order they are recorded on the CD. To activate Random Play, press the RDM button. You will see RDM in the display. The system will then select and play tracks randomly. This continues until you deactivate Random Play by pressing the RDM button again.

If you eject the disc, but do not remove it from the slot, the system will automatically reload the disc after 15 seconds and put the CD player in pause mode. To begin playing the disc, press the CD button.

Press the eject button to remove the disc from the drive.

If you turn the system off while a CD is playing, either with the PWR/VOL knob or by turning off the ignition, the disc will stay in the drive. When you turn the system back on, the CD will begin playing where it left off.

If you eject the disc, but do not remove it from the slot, the system will automatically reload the disc after 15 seconds and put the CD player in pause mode. To begin playing the disc, press the CD button.

Audio System

You can switch to the radio while a CD is playing by pressing the AM/FM button. Press the CD button to return to playing the CD. The CD will begin playing where it left off.

If you turn the system off while a CD is playing, either with the PWR/VOL knob or by turning off the ignition, the disc will stay in the drive. When you turn the system back on, the CD will begin playing where it left off.

Press the eject button to remove the disc from the drive.

If you eject the disc, but do not remove it from the slot, the system will automatically reload the disc after 15 seconds and put the CD player in pause mode. To begin playing the disc, press the CD button.

Audio System

You can switch to the radio while a CD is playing by pressing the AM/FM button. Press the CD button to return to playing the CD. The CD will begin playing where it left off.

If you turn the system off while a CD is playing, either with the PWR/VOL knob or by turning off the ignition, the disc will stay in the drive. When you turn the system back on, the CD will begin playing where it left off.

Press the eject button to remove the disc from the drive.

If you eject the disc, but do not remove it from the slot, the system will automatically reload the disc after 15 seconds and put the CD player in pause mode. To begin playing the disc, press the CD button.

Audio System

You can switch to the radio while a CD is playing by pressing the AM/FM button. Press the CD button to return to playing the CD. The CD will begin playing where it left off.

If you turn the system off while a CD is playing, either with the PWR/VOL knob or by turning off the ignition, the disc will stay in the drive. When you turn the system back on, the CD will begin playing where it left off.

Press the eject button to remove the disc from the drive.

If you eject the disc, but do not remove it from the slot, the system will automatically reload the disc after 15 seconds and put the CD player in pause mode. To begin playing the disc, press the CD button.

Audio System

You can switch to the radio while a CD is playing by pressing the AM/FM button. Press the CD button to return to playing the CD. The CD will begin playing where it left off.

If you turn the system off while a CD is playing, either with the PWR/VOL knob or by turning off the ignition, the disc will stay in the drive. When you turn the system back on, the CD will begin playing where it left off.

Press the eject button to remove the disc from the drive.

If you eject the disc, but do not remove it from the slot, the system will automatically reload the disc after 15 seconds and put the CD player in pause mode. To begin playing the disc, press the CD button.

Audio System

You can switch to the radio while a CD is playing by pressing the AM/FM button. Press the CD button to return to playing the CD. The CD will begin playing where it left off.

If you turn the system off while a CD is playing, either with the PWR/VOL knob or by turning off the ignition, the disc will stay in the drive. When you turn the system back on, the CD will begin playing where it left off.

Press the eject button to remove the disc from the drive.

If you eject the disc, but do not remove it from the slot, the system will automatically reload the disc after 15 seconds and put the CD player in pause mode. To begin playing the disc, press the CD button.
Operating the CD Changer (Optional)
A trunk-mounted Compact Disc changer is available from your dealer. It holds up to six discs, providing several hours of continuous entertainment. You operate this CD changer with the same controls used for the in-dash CD player.

Load the desired CDs in the magazine and load the magazine in the changer according to the instructions that came with the unit. Play only standard round discs. Odd-shaped CDs may jam in the drive or cause other problems.

For best results when using CD-R discs, use only high quality discs labeled for audio use. When recording a CD-R, the recording must be closed in order for the disc to be used by CD players. CD-RW discs will not work in this unit.

To select the CD changer, press the CD button. The disc and track numbers will be displayed.

To select a different disc, press the DISC + (Preset 6) or DISC − (Preset 5) button. The next disc in the changer is loaded and played when you press the DISC + button. DISC − loads and plays the previous disc. If you select an empty slot in the magazine, the changer will, after finding that slot empty, try to load the CD in the next slot. This continues until it finds a CD to load and play.

If you load a CD in the in-dash player while the changer is playing a CD, the system will stop the changer and begin playing the in-dash CD. To select the changer again, press the CD button. Play will begin where it left off. Use the CD button to switch between the player and the changer.

If you eject the disc in the in-dash CD while it is playing, the system will automatically switch to the CD changer and begin play where it left off. If there are no CDs in the changer, the display will flash. You will have to select another mode (AM or FM) with the button.

When you switch back to CD mode, the system selects the same unit (in-dash or changer) that was playing when you switched out of CD mode.

To use the SKIP, REPEAT, and RANDOM functions, refer to the in-dash player operating instructions.
Protecting Compact Discs

Handle a CD by its edges; never touch either surface. Do not place stabilizer rings or labels on the CD. These and contamination from fingerprints, liquids, and felt-tip pens can cause the CD to not play properly, or possibly jam in the drive.

When a CD is not being played, store it in its case to protect it from dust and other contamination. To prevent warpage, keep CDs out of direct sunlight and extreme heat.

To clean a disc, use a clean soft cloth. Wipe across the disc from the center to the outside edge.

A new CD may be rough on the inner and outer edges. The small plastic pieces causing this roughness can flake off and fall on the recording surface of the disc, causing skipping or other problems. Remove these pieces by rubbing the inner and outer edges with the side of a pencil or pen.

Never try to insert foreign objects in the CD player or the magazine.
CD Player Error Indications
If you see an error indication in the display while operating the CD player, find the cause in the chart to the right. If you cannot clear the error indication, take the car to your Honda dealer.

<table>
<thead>
<tr>
<th>Indication</th>
<th>Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;CD EJECT&quot;</td>
<td>FOCUS Error</td>
<td>Press the EJECT button and pull out the disc. Check if the disc is inserted correctly in the CD player. Make sure the disc is not scratched or damaged.</td>
</tr>
<tr>
<td>&quot;CD ERR&quot;</td>
<td>Mechanical Error</td>
<td>Press the EJECT button and pull out the disc. Check the disc for damage or deformation. If the CD cannot be pulled out or the error indication does not disappear after the disc is ejected, see your Honda dealer. Do not try to force the disc out of the player.</td>
</tr>
<tr>
<td>&quot;CD Hot&quot;</td>
<td>High temperature</td>
<td>Will disappear when the temperature returns to normal.</td>
</tr>
</tbody>
</table>
### CD Changer Error Indications
If you see an error indication in the display while operating the CD changer, find the cause in the chart to the right. If you cannot clear the error indication, take the car to your Honda dealer.

<table>

Operating the Cassette Player (Optional)
The cassette system features Dolby noise reduction, automatic sensing of chromium-dioxide (CrO₂) tape, and autoreverse for continuous play.

To operate the optional cassette player, the ignition switch must be in ACCESSORY (I) or ON (II) and the audio system must be on.

Make sure the tape opening on the cassette is facing to the right, then insert the cassette most of the way into the slot. The system will pull it in the rest of the way, and begin to play.

* Dolby noise reduction manufactured under license from Dolby Laboratories Licensing Corporation. “DOLBY” and the double-D symbol are trademarks of Dolby Laboratories Licensing Corporation.
The tape direction indicator will light to show you which side of the cassette is playing. The ▲ indicates the side you inserted facing upward is now playing. If you want to play the other side, press the PLAY/PROG button.

Dolby noise reduction turns on when you insert a cassette. The ▲ indicator will light in the display. If the tape was not recorded with Dolby noise reduction, turn it off by pressing the NR button.

Noise reduction remains off until you turn it on by pressing the button again.

When the system reaches the end of the tape, it will automatically reverse direction and play the other side. If you want to remove the cassette from the drive, press the EJECT button on the cassette player.

If you turn the system off while a tape is playing, either with the PWR/VOL knob or by turning off the ignition, the cassette will remain in the drive. When you turn the system back on, the cassette player will be in pause mode. To begin playing, press the PLAY/PROG button.

To switch to the radio or CD player while a tape is playing, press the AM/FM or CD/TAPE button. To change back to the cassette player, press the CD/TAPE button.

Tape Search Functions
With a cassette playing, you can use the FF, REW, SKIP, or REPEAT function to find a desired program.

FF/REW — Fast Forward and Rewind move the tape rapidly. To rewind the tape, push the REW button. You will see REW in the display. To fast forward the tape, push the FF button. You will see FF displayed. Press the PLAY/PROG button to take the system out of rewind or fast forward. If the system reaches the end of the tape while in fast forward or rewind, it automatically stops that function, reverses direction, and begins to play.
The SKIP and REPEAT functions use silent periods on the tape to find the end of a song or passage. These features may not work to your satisfaction if there is almost no gap between selections, a high noise level between selections, or a silent period in the middle of a selection.

**SKIP** — The Skip Function allows you to find the beginning of a song or passage. To find the beginning of the song or passage currently playing, push the lower part of the SKIP bar. You will see REW flashing in the display as the tape rewinds. To find the beginning of the next song, push the upper part of the SKIP bar. You will see FF flashing in the display as the tape fast forwards. When the system finds the beginning of a song or passage, it goes back to PLAY mode.

**REPEAT** — The Repeat function continuously replays the current song or passage. Press the RPT button to activate it; you will see RPT displayed as a reminder. When the system reaches the end of the song or passage currently playing, it will automatically go into rewind. When it senses the beginning of the same song or passage, the system returns to PLAY mode. It will continue to repeat this same program until you deactivate REPEAT by pressing the button again.
Caring for the Cassette Player

The cassette player picks up dirt and oxides from the tape. This contamination builds up over time and causes the sound quality to degrade. To prevent this, you should clean the player after every 30 hours of use. Your dealer has a cleaning kit available.

If you do not clean the cassette player regularly, it may eventually become impossible to remove the contamination with a normal cleaning kit.

Use 100-minute or shorter cassettes. Cassettes longer than that use thinner tape that may break or jam the drive.

Look at the cassette before you insert it. If the tape is loose, tighten it by turning a hub with a pencil or your finger.

If the label is peeling off, remove it from the cassette or it could cause the cassette to jam in the player. Never try to insert a warped or damaged cassette in the player.

When they are not in use, store cassettes in their cases to protect them from dust and moisture. Never place cassettes where they will be exposed to direct sunlight, high heat, or high humidity. If a cassette is exposed to extreme heat or cold, let it reach a moderate temperature before inserting it in the player.

Never try to insert foreign objects into the cassette player.

If you see the error indication “Tape ERR” on the display, press the EJECT button and remove the cassette from the unit. Make sure the tape is not damaged. If the cassette will not eject or the error indication stays on after the cassette ejects, take the car to your Honda dealer.
Theft Protection
Your car’s audio system will disable itself if it is disconnected from electrical power for any reason. To make it work again, the user must enter a specific five-digit code in the Preset buttons. Because there are hundreds of number combinations possible from five digits, making the system work without knowing the exact code is nearly impossible.

You should have received a card that lists your audio system’s code number and serial number. It is best to store this card in a safe place at home. In addition, you should write the audio system’s serial number in this Owner’s Manual. If you should happen to lose the card, you must obtain the code number from your Honda dealer. To do this, you will need the system’s serial number.

If your car’s battery is disconnected or goes dead, or the radio fuse is removed, the audio system will disable itself. If this happens, you will see “CD” in the frequency display the next time you turn on the system. Use the Preset buttons to enter the five-digit code. If it is entered correctly, the radio will start playing.

If you make a mistake entering the code, do not start over or try to correct your mistake. Complete the five-digit sequence, then enter the correct code. You have ten tries to enter the correct code. If you are unsuccessful in ten attempts, you must then leave the system on for one hour before trying again.

You will have to store your favorite stations in the Preset buttons after the system begins working. Your original settings were lost when power was disconnected.
After you have entered the audio system's code number correctly, the serial number will not be displayed.

Displaying Audio System’s Serial Number
When the audio system disables itself, you can see the eight-digit audio system serial number on the display. To display the serial number:

1. Turn the ignition switch to ACCESSORY (I) or ON (II).

2. Push the PWR/VOL knob to turn on the audio system while pressing the Preset 1 and 6 buttons at the same time.

3. You will see the first 4-digit number on the display for five seconds, then the next 4-digit number is shown for five seconds. You will see 8-digit serial number in total. This procedure is repeated once again.
Cruise control allows you to maintain a set speed above 25 mph (40 km/h) without keeping your foot on the accelerator pedal. It should be used for cruising on straight, open highways. It is not recommended for conditions such as city driving, winding roads, slippery roads, heavy rain, or bad weather. You should have full control of the car under those conditions.

**WARNING**

Improper use of the cruise control can lead to a crash.

Use the cruise control only when traveling on open highways in good weather.

1. Push in the Cruise Control Master Switch to the left of the steering column. The indicator in the switch will light.

2. Accelerate to the desired cruising speed above 25 mph (40 km/h).

CONTINUED
The cruise control may not hold the set speed when you are going up and down hills. If your speed increases going down a hill, use the brakes to slow down to the desired speed. This will cancel the cruise control. To resume the set speed, press the RESUME/accel button. The CRUISE CONTROL light on the instrument panel comes on.

When climbing a steep hill, the automatic transmission may downshift to hold the set speed.

**Changing the Set Speed**
You can increase the set cruising speed in any of these ways:

- Press and hold the RESUME/accel button. The car will accelerate. When you reach the desired cruising speed, release the button.

- To increase your speed in very small amounts, tap the RESUME/accel button repeatedly. Each time you do this, your car will speed up about 1 mph (1.6 km/h).

- Push on the accelerator pedal. Accelerate to the desired cruising speed and press the SET/decel button.

3. Press and release the SET/decel button on the steering wheel. The CRUISE CONTROL light on the instrument panel comes on to show the system is now activated.
You can decrease the set cruising speed in any of these ways:

- Press and hold the SET/decel button. The car will decelerate. Release the button when you reach the desired speed.

- To slow down in very small amounts, tap the SET/decel button repeatedly. Each time you do this, your car will slow down about 1 mph (1.6 km/h).

- Tap the brake or clutch pedal lightly with your foot. The CRUISE CONTROL light on the instrument panel will go out. When the car slows to the desired speed, press the SET/decel button. The car will then maintain the desired speed.

Even with the cruise control turned on, you can still use the accelerator pedal to speed up for passing. After completing the pass, take your foot off the accelerator pedal. The car will return to the set cruising speed.

Resting your foot on the brake or clutch pedal will cause the cruise control to cancel.

You can cancel the cruise control in any of these ways:

- Tap the brake or clutch pedal.

- Push the CANCEL button on the steering wheel.

- Press the Cruise Control Master Switch.

CONTINUED
When you push the CANCEL button, or tap the brake or clutch pedal, the CRUISE CONTROL light on the instrument panel will go out and the car will begin to slow down. You can use the accelerator pedal in the normal way.

The system remembers the previously-set cruising speed. To return to that speed, accelerate to above 25 mph (40 km/h), then press the RESUME/accel button. The CRUISE CONTROL light comes on, and the car will accelerate to the same cruising speed as before.

Pressing the Cruise Control Master Switch turns the system completely off and erases the previous cruising speed from memory. To use the system again, refer to *Using the Cruise Control*. 
Before you begin driving your Honda, you should know what gasoline to use, and how to check the levels of important fluids. You also need to know how to properly store luggage or packages. The information in this section will help you. If you plan to add any accessories to your car, please read the information in this section first.

**Before Driving**

- Break-in Period .......................... 144

Break-in Period
Help assure your car’s future reliability and performance by paying extra attention to how you drive during the first 600 miles (1,000 km). During this period:

- Avoid full-throttle starts and rapid acceleration.
- Avoid hard braking. New brakes need to be broken-in by moderate use for the first 200 miles (300 km).
- Do not change the oil until the recommended time or mileage interval shown in the maintenance schedule.

You should follow these same recommendations with an overhauled or exchanged engine, or when the brakes are relined.

Gasoline
Your Honda is designed to operate on unleaded gasoline with a pump octane number of 86 or higher. Use of a lower octane gasoline can cause a persistent, heavy metallic rapping noise in the engine that can lead to mechanical damage.

We recommend gasolines containing detergent additives that help prevent fuel system and engine deposits.

Using gasoline containing lead will damage your car’s emissions controls. This contributes to air pollution.

In Canada, some gasolines contain an octane-enhancing additive called MMT. If you use such gasolines, your emission control system performance may deteriorate and the Malfunction Indicator Lamp on your instrument panel may turn on. If this happens, contact your authorized Honda dealer for service.
1. Because the fuel fill cap is on the driver's side of the car, park with that side closest to the service station pumps.

2. Open the fuel fill door by pushing on the handle to the left of the driver's seat.

3. Remove the fuel fill cap slowly. You may hear a hissing sound as pressure inside the tank escapes. Place the cap in the holder on the fuel fill door.

4. Stop filling the tank after the fuel nozzle automatically clicks off. Do not try to “top off” the tank, leave some room for the fuel to expand with temperature changes.

Your car has an on-board refueling vapor recovery system to help keep fuel vapors from going into the atmosphere. If the fuel nozzle keeps clicking off even though the tank is not full, there may be a problem with this system. Consult your dealer.
5. Screw the fuel fill cap back on, tighten it until it clicks several times. If you do not properly tighten the cap, the Malfunction Indicator Lamp may come on (see page 273).

6. Push the fuel fill door closed until it latches.

Opening the Hood

1. Shift to Park or Neutral and set the parking brake. Pull the hood release handle located under the lower left corner of the dashboard. The hood will pop up slightly.

2. Standing in front of the car, put your fingers between the front edge of the hood and the front grille. The hood latch handle is above the “H” logo. Push this handle up until it releases the hood. Lift the hood.
If you can open the hood without lifting the hood latch handle, or the hood latch handle moves stiffly or does not spring back as before, the mechanism should be cleaned and lubricated (see page 212).

3. Pull the support rod out of its clip by holding the grip and insert the end into the hole on the front left side of the hood.

To close the hood, lift it up slightly to remove the support rod from the hole. Put the support rod back into its holding clip. Lower the hood to about a foot (30 cm) above the fender, then let it drop.

After closing the hood, make sure it is securely latched.

CONTINUED
Check the engine oil level every time you fill the car with fuel. Wait a few minutes after turning the engine off before you check the oil.

1. Remove the dipstick (orange handle).

2. Wipe the dipstick with a clean cloth or paper towel.

3. Insert it all the way back in its tube.
4. Remove the dipstick again and check the level. It should be between the upper and lower marks.

If it is near or below the lower mark, see Adding Oil on page 195.

Look at the coolant level in the radiator reserve tank. Make sure it is between the MAX and MIN lines. If it is below the MIN line, see Adding Engine Coolant on page 199 for information on adding the proper coolant.

Refer to Owner Maintenance Checks on page 193 for information on checking other items in your Honda.
The condition of your car and your driving habits are the two most important things that affect the fuel mileage you get.

Vehicle Condition
Always maintain your car according to the maintenance schedule. This will keep it in top operating condition.

An important part of that maintenance is the Owner Maintenance Checks (see page 193). For example, an underinflated tire causes more “rolling resistance,” which uses fuel. It also wears out faster, so check the tire pressure at least monthly.

Engine oil also affects fuel economy. The fuel efficient, low-viscosity 0W-20 oil recommended for your Civic Hybrid is formulated to help the engine use less fuel. This oil is available at your Honda dealer.

In winter, the build-up of snow on your car's underside adds weight and rolling resistance. Frequent cleaning helps your fuel mileage and reduces the chance of corrosion.

Driving Habits
You can improve fuel economy by driving moderately. Rapid acceleration, abrupt cornering, and hard braking use more fuel.

To get the best fuel mileage, drive in the highest gear that is practical for the speed you are driving, and always accelerate slowly.

You may find that your Civic Hybrid’s unique combination of an engine and an electric motor has driving characteristics that are somewhat different from what you are used to. Shift Up and Shift Down indicators (5-speed manual transmission only) on the instrument panel show when to shift to a higher or lower gear. By shifting as soon as the indicator comes on, you will keep the engine operating in its most economical range.
Depending on traffic conditions, try to maintain a constant speed. Every time you slow down and speed up, your car uses extra fuel. Use the cruise control, when appropriate, to increase fuel economy.

Wind resistance causes vehicles to use more fuel at higher speeds. Driving at moderate speeds on the highway reduces wind resistance and conserves fuel.

A cold engine uses more fuel than a warm engine. It is not necessary to “warm-up” a cold engine by letting it idle for a long time. You can drive away in about a minute, no matter how cold it is outside. The engine will warm up faster, and you get better fuel economy. To cut down on the number of “cold starts,” try to combine several short trips into one.

The air conditioning puts an extra load on the engine which makes it use more fuel. Turn off the A/C to cut down on air conditioning use. Use the flow-through ventilation when the outside air temperature is moderate.

If air conditioning is needed, you can save some fuel by using the A/C in “ECON” mode. When the outside temperature is above 41°F (5°C), this mode allows the Auto Idle Stop function to shut off the engine when the vehicle is stopped, resulting in fuel savings.

You may notice that using the A/C causes a greater drop in fuel economy than you are used to in other vehicles. Although the amount of extra fuel used by the A/C load on the engine is no greater than other vehicles, it is more noticeable because of your Civic Hybrid’s excellent fuel mileage. Using the A/C in hot weather may result in fuel economy that is lower than expected.
Modifying your car, or installing some non-Honda accessories, can make your car unsafe. Before you make any modifications or add any accessories, be sure to read the following information.

**Accessories**

Your dealer has Honda accessories that allow you to personalize your car. These accessories have been designed and approved for your car, and are covered by warranty.

Non-Honda accessories are usually designed for universal applications. Although aftermarket accessories may fit on your car, they may not meet factory specifications, and could adversely affect your car’s handling and stability. (See “Modifications” on page 153 for additional information.)

---

### WARNING

**Improper accessories or modifications can affect your car’s handling, stability and performance, and cause a crash in which you can be hurt or killed.**

Follow all instructions in this owner’s manual regarding accessories and modifications.

When properly installed, cellular phones, alarms, two-way radios, and low-powered audio systems should not interfere with your car’s computer-controlled systems, such as the SRS and anti-lock brake system.

However, if electronic accessories are improperly installed, or exceed your car’s electrical system capacity, they can interfere with the operation of your car, or even cause the airbags to deploy.

Before installing any accessory:

- Make sure the accessory does not obscure any lights, or interfere with proper car operation or performance.
- Be sure electronic accessories do not overload electrical circuits (see page 276).
- Have the installer contact your Honda dealer for assistance before installing any electronic accessory.

If possible, have your dealer inspect the final installation.
**Accessories and Modifications**

**Modifications**
Removing parts from your vehicle, or replacing components with non-Honda (aftermarket) components could seriously affect your vehicle’s handling, stability, and reliability.

Some examples are:
• Lowering the vehicle with an aftermarket suspension kit that significantly reduces ground clearance can allow the undercarriage to impact speed bumps or other raised objects, which could cause the airbags to deploy.

• Raising the vehicle with an aftermarket suspension kit can affect the handling and stability.

• Aftermarket wheels, because they are a universal design, can cause excessive stress on suspension components.

• Larger or smaller wheels and tires can interfere with the operation of your vehicle’s anti-lock brakes and other systems.

Do not modify your steering wheel or any other part of your Supplemental Restraint System. Modifications could make the system ineffective.

If you plan to modify your vehicle, consult with your Honda dealer.

**Additional Safety Precautions**
• Do not attach or place objects on the front airbag covers. Any object attached to or placed on the covers marked “SRS AIRBAG,” in the center of the steering wheel and on top of the dashboard, could interfere with the proper operation of the airbags. Or, if the airbags inflate, the objects could be propelled inside the car and hurt someone.

• Do not attach hard objects on or near a front door. If a side airbag inflates, a cup holder or other hard object attached on or near the door could be propelled inside the car and hurt someone.

• Do not place any objects over the outside edge of a front seat-back. Covering the outside edge of a front seat-back, with a non-Honda seat cover for example, could prevent the airbag from inflating properly.

Only on models equipped with side airbags

Before Driving 153
Your car has several convenient storage areas so you can stow cargo safely.

The glove box, and the pockets in the front doors and seat-back, are designed for small, lightweight items. The trunk is intended for larger, heavier items.

However, carrying too much cargo, or improperly storing it, can affect your car’s handling, stability, and operation and make it unsafe. Before carrying any type of cargo, be sure to read the following pages.
Carrying Cargo

Load Limit
The maximum load for your car is 850 lbs in U.S. models and 395 kg in Canadian models.

This figure includes the total weight of all occupants, cargo, and accessories.

To figure out how much cargo you can carry:

- Add up the weight of all occupants.
- Subtract the total from 850 lbs in U.S. models and 395 kg in Canadian models.

The final number is the total weight of cargo you can carry.

**WARNING**
Overloading or improper loading can affect handling and stability and cause a crash in which you can be hurt or killed.

Follow all load limits and other loading guidelines in this manual.

Carrying Items in the Passenger Compartment
- Store or secure all items that could be thrown around and hurt someone during a crash.
- Do not put any items on top of the trunk panel. They can block your view and be thrown around the car during a crash.
- Be sure items placed on the floor behind the front seats cannot roll under the seats and interfere with the driver’s ability to operate the pedals, or with the proper operation of the seats.
- Keep the glove box closed while driving. If the lid is open, a passenger could injure their knees during a crash or sudden stop.
Carrying Cargo in the Trunk or on a Roof Rack

- Distribute cargo evenly on the floor of the trunk, placing the heaviest items on the bottom and as far forward as possible.

- Tie down items that could be thrown about the car during a crash or sudden stop.

- If you carry large items that prevent you from closing the trunk lid, exhaust gas can enter the passenger area. To avoid the possibility of carbon monoxide poisoning, follow the instructions on page 54.

- If you can carry any items on a roof rack, be sure the total weight of the rack and the items does not exceed the maximum allowable weight. Please contact your Honda dealer for further information.
The air intake for the IMA battery is located on top of the trunk panel. Do not block this air intake, it may cause the IMA battery and the power control unit to overheat, causing the IMA to shut down. It will start working again after it cools.

Do not spill any liquids over the air intake and also do not put any small foreign objects in it. This may damage the IMA battery and the power control unit.
This section gives you tips on starting the engine under various conditions, and how to operate the 5-speed manual and automatic transmissions. It also includes important information on parking your car, and the braking system.

You should do the following checks and adjustments every day before you drive your car.

1. Make sure all windows, mirrors, and outside lights are clean and unobstructed. Remove frost, snow, or ice.

2. Check that the hood and trunk are fully closed.

3. Visually check the tires. If a tire looks low, use a gauge to check its pressure.

4. Check that any items you may be carrying with you inside are stored properly or fastened down securely.

5. Check the adjustment of the seat (see page 94).

6. Check the adjustment of the inside and outside mirrors (see page 99).

7. Check the adjustment of the steering wheel (see page 82).

8. Make sure the doors are securely closed and locked.

9. Fasten your seat belt. Check that your passengers have fastened their seat belts (see page 16).

10. Turn the ignition switch ON (II). Check the indicator lights in the instrument panel.

11. Start the engine (see page 161).

12. Check the gauges and indicator lights in the instrument panel (see page 59).
1. Apply the parking brake.
2. In cold weather, turn off all electrical accessories to reduce the drain on the battery.
3. **Manual Transmission:**
   Push the clutch pedal down all the way. START (III) does not function unless the clutch pedal is depressed.

   **Automatic Transmission (CVT):**
   Make sure the shift lever is in Park. Press on the brake pedal.
4. Without touching the accelerator pedal, turn the ignition key to the START (III) position. If the engine does not start right away, do not hold the key in START (III) for more than 15 seconds at a time. Pause for at least 10 seconds before trying again.
5. If the engine does not start within 15 seconds, or starts but stalls right away, repeat step 4 with the accelerator pedal pressed half-way down. If the engine starts, release pressure on the accelerator pedal so the engine does not race.
6. If the engine still does not start, press the accelerator pedal all the way down and hold it there while starting in order to clear flooding. As before, keep the ignition key in the START (III) position for no more than 15 seconds. Return to step 5 if the engine does not start. If it starts, lift your foot off the accelerator pedal so the engine does not race.

**Starting in Cold Weather at High Altitude (Above 8,000 feet/2,400 meters)**
An engine is harder to start in cold weather. The thinner air found at high altitude above 8,000 feet (2,400 meters) adds to the problem.

Use the following procedure:

1. Turn off all electrical accessories to reduce the drain on the battery.
2. Push the accelerator pedal half-way to the floor and hold it there while starting the engine. Do not hold the ignition key in START (III) for more than 15 seconds. When the engine starts, release the accelerator pedal gradually as the engine speeds up and smooths out.
3. If the engine fails to start in step 2, push the accelerator pedal to the floor and hold it there while you try to start the engine for no more than 15 seconds. If the engine does not start, return to step 2.
Come to a full stop before you shift into Reverse. You can damage the transmission by trying to shift into Reverse with the car moving. Push down the clutch pedal, and pause for a few seconds before shifting into Reverse, or shift into one of the forward gears for a moment. This stops the gears so they won’t “grind.”

When slowing down, you can get extra braking from the engine by shifting to a lower gear. This extra braking can help you maintain a safe speed and prevent your brakes from overheating while going down a steep hill. Before downshifting, make sure the vehicle speed is low enough that you will not activate the engine speed limiter in the lower gear. Make sure the engine speed will not go into the tachometer’s red zone in the lower gear before downshifting.

The manual transmission is synchronized in all forward gears for smooth operation. It has a detent so you cannot shift directly from Fifth to Reverse. When shifting up or down, make sure you push the clutch pedal down all the way, shift to the next gear, and let the pedal up gradually. When you are not shifting, do not rest your foot on the clutch pedal. This can cause your clutch to wear out faster.

**WARNING**

Rapid slowing or speeding-up can cause loss of control on slippery surfaces. If you crash, you can be injured.

Use extra care when driving on slippery surfaces.
Auto Idle Stop
To maximize fuel economy, your Civic Hybrid has an Auto Idle Stop function. Under certain conditions, the engine will shut off when you come to a stop. Those conditions are:

- The engine coolant is nearly up to normal operating temperature.
- The vehicle’s speed is below 19 mph (30 km/h) and you are pressing on the brake pedal to come to a stop.
- You depress the clutch pedal.
- You are not pressing on the accelerator pedal.
- The IMA battery is charged enough to operate the system.
- The ECON mode is selected, and the outside temperature is above 41°F (5°C), or the fan speed control dial is off (see page 111).
- There is adequate vacuum reserve for the power brakes.

When these conditions are met, the engine will shut off as you come to a stop. It will start again automatically when you depress the clutch pedal and move the shift lever to first gear. There is no need to start the engine with the ignition switch.

It is recommended that you move the shift lever to Neutral and remove your foot from the clutch pedal while you are stopped. Sitting with the clutch pedal depressed and the shift lever in gear will cause the engine to continue running, defeating the fuel economy benefits of the Auto Idle Stop function.

During Auto Idle Stop, the IMA charge and power brake vacuum reserve is monitored by the system. If either drops below a desired level, and the shift lever is in Neutral, the engine will restart so it can recharge the IMA battery or replenish the vacuum supply.

The Auto Idle Stop function may not activate when starting the engine or if the IMA battery temperature is too hot or too cold.
This indicator comes on as a reminder that the engine has stopped because of the Auto Idle Stop function. When the indicator is off, it means that Auto Idle Stop is not active. When the indicator is on, but the engine is not running, it means the clutch pedal is depressed, but the transmission is not in gear. When the indicator is blinking, it means the clutch pedal is not depressed. You cannot restart the engine with the ignition switch when this light is blinking.

This indicator will blink, and you will hear a continuous beep, if you open the door when Auto Stop is active. The beep will stop when you close the door.

Always turn the ignition switch to LOCK (0) and remove the key if you are getting out of the vehicle.
If you exceed the maximum speed for the gear you are in, the engine speed will enter into the tachometer’s red zone. If this occurs, you may feel the engine cut in and out. This is caused by a limiter in the engine’s computer controls. The engine will run normally when you reduce the RPM below the red zone.

Before downshifting, make sure the engine will not go into the tachometer’s red zone.

Either the Shift Up or Shift Down indicator will light to show the best time to shift to a higher or lower gear. You can achieve the best fuel economy by accelerating and decelerating slowly, and shifting when prompted by the Shift Up indicator.

The Shift Down indicator prompts you to shift to a lower gear when you are climbing a hill faster than 12 mph (19 km/h), losing speed, and pressing on the accelerator pedal.

Road and traffic conditions may require you to shift at times other than those indicated.

**Engine Speed Limiter**

If you exceed the maximum speed for the gear you are in, the engine speed will enter into the tachometer’s red zone. If this occurs, you may feel the engine cut in and out. This is caused by a limiter in the engine’s computer controls. The engine will run normally when you reduce the RPM below the red zone.

Before downshifting, make sure the engine will not go into the tachometer’s red zone.
Honda’s Continuously Variable automatic transmission’s unique design provides a smooth, constant flow of power. It is electronically controlled for more precise operation and better fuel economy.

The “D” indicator comes on for a few seconds when you turn the ignition switch ON (II). If it flashes while driving (in any shift position), it indicates a possible problem in the transmission. Avoid rapid acceleration and have the transmission checked by an authorized Honda dealer as soon as possible.

The malfunction indicator lamp may come on along with the “D” indicator if there is a problem in the continuously variable transmission control system.
Shift Lever Positions

The shift lever has six positions. It must be in Park or Neutral to start the engine. When you are stopped in D, S, L, N or R, press firmly on the brake pedal and keep your foot off the accelerator pedal.

<table>
<thead>
<tr>
<th>To shift from:</th>
<th>Do this:</th>
</tr>
</thead>
<tbody>
<tr>
<td>P to R</td>
<td>Press the brake pedal and press the release button.</td>
</tr>
<tr>
<td>R to P</td>
<td>Press the release button.</td>
</tr>
<tr>
<td>N to R</td>
<td>Press the release button.</td>
</tr>
<tr>
<td>S to L</td>
<td>Move the lever.</td>
</tr>
</tbody>
</table>

Park (P) — This position mechanically locks the transmission. Use Park whenever you are turning off or starting the engine. To shift out of Park, you must press on the brake pedal and have your foot off the accelerator pedal. Press the release button on the front of the shift lever to move it.
If you have done all of the above and still cannot move the lever out of Park, see Shift Lock Release on page 170.

You must also press the release button to shift into Park. To avoid transmission damage, come to a complete stop before shifting into Park. The shift lever must be in Park before you can remove the key from the ignition switch.

**Reverse (R)** — To shift to Reverse from Park, see the explanation under Park. To shift to Reverse from Neutral, come to a complete stop and then shift. Press the release button before shifting into Reverse from Neutral.

**Neutral (N)** — Use Neutral if you need to restart a stalled engine, or if it is necessary to stop briefly with the engine idling. Always shift to Park position if you need to leave the car for any reason. Press on the brake pedal when you are moving the shift lever from Neutral to another position.

**Drive (D)** — Use this position for your normal driving. The transmission automatically adjusts to keep the engine at the best speed for driving conditions. To help the engine warm up faster, the transmission will select ratios that allow the engine to run at higher speeds when it is cold.
Second (S) — Selecting Second shifts the transmission into a lower range of ratios for better acceleration and increased engine braking. Use Second when you are going down a steep hill, or in stop-and-go driving.

Low (L) — To shift to Low, press the release button on the front of the shift lever. Use Low to get more power when climbing, and for maximum engine braking when going down steep hills.

For faster acceleration when in D, S or L, the transmission will automatically “kick down” to a lower range of ratios by pushing the accelerator pedal to the floor.

Engine Speed Limiter
The CVT shifts automatically to maintain proper engine speed in any shift position.

When the vehicle reaches the maximum speed in any shift position, you may feel the engine cut in and out. This is caused by a limiter (112 mph, 180 km/h) in the engine’s computer controls. The engine will run normally when you reduce the speed to below the maximum.
**Shift Lock Release**
This allows you to move the shift lever out of Park if the normal method of pushing on the brake pedal and pressing the release button does not work.

1. Set the Parking brake.

2. Remove the key from the ignition switch.

3. Put a cloth on the edge of the Shift Lock Release slot cover next to the shift lever. Use a small flat-tipped screwdriver or small metal plate (neither are included in the tool kit) to remove the cover. Carefully pry on the edge of the cover.

4. Insert the key in the Shift Lock Release slot.

5. Push down on the key while you press the release button on the shift lever and move the shift lever out of Park to Neutral.

6. Remove the key from the Shift Lock Release slot, then reinstall the cover. Make sure the notch on the cover is on the left side. Return the key to the ignition switch, depress the brake pedal, and restart the engine.

If you need to use the Shift Lock Release, it means your car is developing a problem. Have the car checked by your Honda dealer.
Auto Idle Stop
To maximize fuel economy, your Civic Hybrid has an Auto Idle Stop function. Under certain conditions, the engine will shut off when you come to a stop. Those conditions are:

- The engine coolant is nearly up to normal operating temperature.
- The shift lever is in D or N.
- You are not pressing on the accelerator pedal.
- The IMA battery is charged enough to operate the system.
- The ECON mode is selected, and the outside temperature is above 41°F (5°C), or the fan speed control dial is off (see page 111).

- There is adequate vacuum reserve for the power brakes.

When these conditions are met after the vehicle speed has exceeded 10 mph (16 km/h), the engine will shut off as you are braking to a stop and the vehicle speed goes below 5 mph (8 km/h).

The engine will start again when you release the brake pedal. It will also restart, even if you are still pressing the brake pedal, under these conditions:

- You move the shift lever from D or N to R or L.
- You press the accelerator pedal.
- You are on an incline, and the vehicle begins rolling.

During Auto Idle Stop, the IMA charge and power brake vacuum reserve is monitored by the system. If the vacuum reserve drops below an optimal level, the engine will restart to replenish the vacuum supply. If the IMA charge drops below an optimal level and the shift lever is in Neutral or Park (P), the engine will restart to recharge the IMA battery.

The Auto Idle Stop function may not activate when starting the engine or if the IMA battery temperature is too hot or too cold.
The indicator blinks as a reminder that the engine has stopped because of the Auto Idle Stop function. You cannot restart the engine with the ignition switch when this light is blinking.

If you open the driver's door when Auto Stop is active, the indicator will blink and you will hear a continuous beep. The beep will stop when you close the door.

With the driver’s door open, you will hear a continuous beep even if the Auto Idle Stop function is deactivated and the engine restarts.

Always turn the ignition switch to LOCK (0) and remove the key if you are getting out of the car.
Always use the parking brake when you park your car. The indicator on the instrument panel shows that the parking brake is not fully released; it does not indicate that the parking brake is firmly set. Make sure the parking brake is set firmly or your car may roll if it is parked on an incline.

If your car has an automatic transmission, set the parking brake before you put the transmission in Park. This keeps the car from moving and putting pressure on the parking mechanism in the transmission — making it easier to move the shift lever out of Park when you want to drive away.

If the car is facing uphill, turn the front wheels away from the curb. If you have a manual transmission, put it in first gear.

If the car is facing downhill, turn the front wheels toward the curb. If you have a manual transmission, put it in reverse gear.

Make sure the parking brake is fully released before driving away. Driving with the parking brake partially set can overheat or damage the rear brakes.

Parking Tips
- Make sure the windows are closed.
- Turn off the lights.
- Place any packages, valuables, etc., in the trunk or take them with you.
- Lock the doors with the key or the remote transmitter.
- Never park over dry leaves, tall grass, or other flammable materials. The three way catalytic converter gets very hot, and could cause these materials to catch on fire.
The Braking System

The Civic Hybrid is equipped with front disc brakes. The brakes on the rear wheels are drum. A power assist helps reduce the effort needed on the brake pedal. The ABS (on cars equipped with ABS) helps you retain steering control when braking very hard.

Put your foot on the brake pedal only when you intend to brake. Resting your foot on the pedal keeps the brakes applied lightly, causing them to build up heat. Heat build-up can reduce how well your brakes work. It also keeps your brake lights on all the time, confusing drivers behind you.

Constant application of the brakes when going down a long hill builds up heat and reduces their effectiveness. Use the engine to assist the brakes by downshifting to a lower gear and taking your foot off the accelerator pedal.

Check your brakes after driving through deep water. Apply the brakes moderately to see if they feel normal. If not, apply them gently and frequently until they do. Since a longer distance is needed to stop with wet brakes, be extra cautious and alert in your driving.

Brake Wear Indicators
The front disc brakes on all models have audible brake wear indicators. When the brake pads need replacing, you will hear a distinctive metallic “screeching” sound when you apply the brakes. If you do not have the brake pads replaced, they will begin screeching all the time.

Your brakes may sometimes squeal or squeak when you apply them lightly. Do not confuse this with the brake wear indicators. They make a very audible “screeching.”
**Brake System Design**
The hydraulic system that operates the brakes has two separate circuits. Each circuit works diagonally across the vehicle (the left-front brake is connected with the right-rear brake, etc.). If one circuit should develop a problem, you will still have braking at two wheels.

**Anti-lock Brakes (Optional)**
ABS helps to prevent the wheels from locking up and skidding during hard braking, allowing you to retain steering control.

When the front tires skid, you lose steering control; the car continues straight ahead even though you turn the steering wheel. The ABS helps to prevent lock-up and helps you retain steering control by pumping the brakes rapidly; much faster than a person can do it.

The ABS also balances the front-to-rear braking distribution according to vehicle loading.

**You should never pump the brake pedal;** this defeats the purpose of the ABS. Let the ABS work for you by always keeping firm, steady pressure on the brake pedal as you steer away from the hazard. This is sometimes referred to as “stomp and steer.”

You will feel a pulsation in the brake pedal when the ABS activates, and you may hear some noise. This is normal; it is the ABS rapidly pumping the brakes.
The Braking System

Activation varies with the amount of traction your tires have. On dry pavement, you will need to press on the brake pedal very hard before you activate the ABS. However, you may feel the ABS activate immediately if you are trying to stop on snow or ice.

**Important Safety Reminders**

**ABS does not reduce the time or distance it takes to stop the car,** it only helps with steering control during braking. You should always maintain a safe following distance from other vehicles.

**ABS will not prevent a skid that results from changing direction abruptly,** such as trying to take a corner too fast or making a sudden lane change. Always drive at a safe, prudent speed for the road and weather conditions.

**ABS cannot prevent a loss of stability.** Always steer moderately when you are braking hard. Severe or sharp steering wheel movement can still cause your car to veer into oncoming traffic or off the road.

A vehicle with ABS may require a longer distance to stop on loose or uneven surfaces, such as gravel or snow, than a vehicle without anti-lock. Slow down and allow a greater distance between vehicles under those conditions.
The ABS is self-checking. If anything goes wrong, the ABS indicator on the instrument panel comes on (see page 62). This means the anti-lock function of the braking system has shut down. The brakes still work like a conventional system without anti-lock, providing normal stopping ability. You should have the dealer inspect your car as soon as possible.

If the ABS indicator and the brake system indicator come on together, and the parking brake is fully released, the front-to-rear braking distribution system may also shut down.

Test your brakes as instructed on page 275. If the brakes feel normal, drive slowly and have your car repaired by your dealer as soon as possible. Avoid sudden hard braking which could cause the rear wheels to lock up and possibly lead to a loss of control.
Driving in Bad Weather

Driving Technique — Always drive slower than you would in dry weather. It takes your car longer to react, even in conditions that may seem just barely damp. Apply smooth, even pressure to all the controls. Abrupt steering wheel movements or sudden, hard application of the brakes can cause loss of control in wet weather. Be extra cautious for the first few miles (kilometers) of driving while you adjust to the change in driving conditions. This is especially true in snow. A person can forget some snow-driving techniques during the summer months. Practice is needed to relearn those skills.

Exercise extra caution when driving in rain after a long dry spell. After months of dry weather, the first rains bring oil to the surface of the roadway, making it slippery.

Visibility — Being able to see clearly in all directions and being visible to other drivers are important in all weather conditions. This is more difficult in bad weather. To be seen more clearly during daylight hours, turn on your headlights.

Inspect your windshield wipers and washers frequently. Keep the windshield washer reservoir full of the proper fluid. Have the windshield wiper blades replaced if they start to streak the windshield or leave parts unwiped. Use the defrosters and air conditioning to keep the windows from fogging up on the inside (see page 116).

Rain, fog, and snow conditions require a different driving technique because of reduced traction and visibility. Keep your car well-maintained and exercise greater caution when you need to drive in bad weather. The cruise control should not be used in these conditions.
Check your tires frequently for wear and proper pressure. Both are important in preventing "hydroplaning" (loss of traction on a wet surface). In the winter, mount snow tires on all four wheels for the best handling.

Watch road conditions carefully, they can change from moment to moment. Wet leaves can be as slippery as ice. "Clear" roads can have patches of ice. Driving conditions can be very hazardous when the outside temperature is near freezing. The road surface can become covered with areas of water puddles mixed with areas of ice, so your traction can change without warning.

Be careful when downshifting. If traction is low, you can lock up the drive wheels for a moment and cause a skid.

Towing a Trailer
Your vehicle is not designed to tow a trailer. Attempting to do so can void your warranties.
This section explains why it is important to keep your car well maintained and how to follow basic maintenance safety precautions.

This section also includes Maintenance Schedules for normal driving and severe driving conditions, a Maintenance Record, and instructions for simple maintenance tasks you may want to take care of yourself.

If you have the skills and tools to perform more complex maintenance tasks on your Honda, you may want to purchase the Service Manual. See page 303 for information on how to obtain a copy, or see your Honda dealer.
Some of the most important safety precautions are given here. However, we cannot warn you of every conceivable hazard that can arise in performing maintenance. Only you can decide whether or not you should perform a given task.

Regularly maintaining your car is the best way to protect your investment. Proper maintenance is essential to your safety and the safety of your passengers. It will also reward you with more economical, trouble-free driving and help reduce air pollution.

**WARNING**

Improperly maintaining this car or failing to correct a problem before driving can cause a crash in which you can be seriously hurt or killed.

Always follow the inspection and maintenance recommendations and schedules in this owner’s manual.

**WARNING**

Failure to properly follow maintenance instructions and precautions can cause you to be seriously hurt or killed.

Always follow the procedures and precautions in this owner’s manual.
Important Safety Precautions
Before you begin any maintenance, make sure your car is parked on level ground and that the parking brake is set. Also, be sure the engine is off. This will help to eliminate several potential hazards:

• **Carbon monoxide poisoning from engine exhaust.** Be sure there is adequate ventilation whenever you operate the engine.

• **Burns from hot parts.** Let the engine and exhaust system cool before touching any parts.

• **Injury from moving parts.** Do not run the engine unless instructed to do so.

Read the instructions before you begin, and make sure you have the tools and skills required.

To reduce the possibility of fire or explosion, be careful when working around gasoline or batteries. Use a commercially available degreaser or parts cleaner, not gasoline, to clean parts. Keep cigarettes, sparks, and flames away from the battery and all fuel-related parts.

You should wear eye protection and protective clothing when working near the battery or when using compressed air.
The Maintenance Schedule specifies how often you should have your car serviced and what things need attention. It is essential that you have your car serviced as scheduled to retain its high level of safety, dependability, and emissions control performance.

The services and time or distance intervals shown in the maintenance schedule assume you will use your car as normal transportation for passengers and their possessions. You should also follow these recommendations:

• Avoid exceeding your car’s load limit. This puts excess stress on the engine, brakes, and many other parts of your car. The load limit is shown on the label on the driver’s doorjamb.

• Operate your car on reasonable roads within the legal speed limit.

• Drive your car regularly over a distance of several miles (kilometers).

• Always use unleaded gasoline with the proper octane rating (see page 144).

**Which Schedule to Follow:**
Service your car according to the time and mileage periods on one of the Maintenance Schedules on the following pages.

**U.S. Owners** — Follow the Maintenance Schedule for Severe Conditions if you drive your car MAINLY under one or more of the following conditions.

• Driving less than 5 miles (8 km) per trip or, in freezing temperatures, driving less than 10 miles (16 km) per trip.

• Driving in extremely hot [over 90°F (32°C)] conditions.

• Extensive idling or long periods of stop-and-go driving, such as a taxi or a commercial delivery vehicle.
According to state and federal regulations, failure to perform maintenance on the items marked with # will not void your emissions warranties. However, Honda recommends that all maintenance services be performed at the recommended time or mileage period to ensure long-term reliability.

- Driving with a roof rack, or driving in mountainous conditions.
- Driving on muddy, dusty, or de-iced roads.

**NOTE:** If you only OCCASIONALLY or NEVER, drive under a “severe” condition, you should follow the Maintenance Schedule for Normal Conditions.

**Canadian Owners** — Follow the Maintenance Schedule for Severe Conditions.

Your authorized Honda dealer knows your car best and can provide competent, efficient service. However, service at a dealer is not mandatory to keep your warranties in effect. Maintenance may be done by any qualified service facility or person who is skilled in this type of automotive service. Keep all the receipts as proof of completion, and have the person who does the work fill out the Maintenance Record. Check your warranty booklet for more information.

We recommend the use of Honda parts and fluids whenever you have maintenance done. These are manufactured to the same high-quality standards as the original components, so you can be confident of their performance and durability.

**U.S. Vehicles:**

**Maintenance, replacement or repair of emissions control devices and systems may be done by any automotive repair establishment or individual using parts that are “certified” to EPA standards.**

### Check engine oil and coolant
- Check oil and coolant at each fuel stop

### Replace engine oil
- Replace every 5,000 miles (8,000 km) or 6 months

### Rotate tires (Check tire inflation and condition at least once per month)

### Replace engine oil filter

### Inspect and rear brakes

### Lubricate all hinges, locks, and latches

### Visually inspect the following items:
- Tie rod ends, steering gear box and boots
- Suspension components
- Driveshaft boots

### Check parking brake adjustment

### Visually inspect the following items:
- Brake hoses and lines (including ABS)
- All fluid levels and condition of fluids: *
- Exhaust system, °Fuel lines and connections
- Lights and controls, Vehicle underbody

### Inspect and adjust drive belts

### Replace dust and pollen filter

### Replace transmission fluid

</table>
You should check the following items at the specified intervals. If you are unsure of how to perform any check, turn to the page given.

- Engine oil level — Check every time you fill the fuel tank. See page 148.

- Engine coolant level — Check the radiator reserve tank every time you fill the fuel tank. See page 149.

- Windshield washer fluid — Check the level in the reservoir monthly. If weather conditions cause you to use the washers frequently, check the reservoir each time you stop for fuel. See page 205.

- Automatic transmission (CVT) — Check the fluid level monthly. See page 206.

- Brakes — Check the fluid level monthly. See page 209.

- Tires — Check the tire pressure monthly. Examine the tread for wear and foreign objects. See page 225.

- Lights — Check the operation of the headlights, parking lights, taillights, high-mount brake light, turn signals, brake lights, and license plate lights monthly. See page 232.
Fluid Locations

- **ENGINE OIL DIPSTICK** (Orange loop)
- **ENGINE OIL FILL CAP**
- **BRAKE FLUID** (Gray cap)
- **CLUTCH FLUID** (Manual Transmission only) (Gray cap)
- **WASHER FLUID** (Blue cap)
- **ENGINE COOLANT RESERVOIR**
- **CONTINUOUSLY VARIABLE TRANSMISSION (CVT) FLUID DIPSTICK** (Yellow loop)
- **RADIATOR CAP**
Adding Oil

To add oil, unscrew and remove the engine oil fill cap on top of the valve cover. Pour in the oil, and install the engine oil fill cap. Tighten it securely. Wait a few minutes and recheck the oil level. Do not fill above the upper mark; you could damage the engine.

Pour the oil slowly and carefully so you do not spill. Clean up any spills immediately. Spilled oil could damage components in the engine compartment.

**Recommended Oil**

Oil is a major contributor to your engine’s performance and longevity. Always use a premium-grade 0W-20 detergent oil displaying the API Certification Seal. This seal indicates the oil is energy conserving, and that it meets the American Petroleum Institute’s latest requirements.

Honda Motor Oil is the preferred 0W-20 lubricant for your vehicle. It is highly recommended that you use Honda Motor Oil in your vehicle for optimum engine protection.

Make sure the API Certification Seal says “For Gasoline Engines.”

CONTINUED
You may use a synthetic motor oil if it meets the same requirements given for a conventional motor oil: it displays the API Certification Seal, and it is the proper weight as shown on the chart. When using synthetic oil, you must follow the oil and filter change intervals given in the maintenance schedule.

Additives
Your Honda does not require any oil additives. Additives may adversely affect your engine’s or transmission’s performance and durability.
Changing the Oil and Filter
Always change the oil and filter according to the time and distance (miles/kilometers) recommendations in the maintenance schedule. The oil and filter collect contaminants that can damage your engine if they are not removed regularly.

Changing the oil and filter requires special tools and access from underneath the car. The car should be raised on a service station-type hydraulic lift for this service. Unless you have the knowledge and proper equipment, you should have this maintenance done by a skilled mechanic.

1. Run the engine until it reaches normal operating temperature, then shut it off.
2. Open the hood and remove the engine oil fill cap.
3. Remove the nine holding clips with a flat-tipped screwdriver, then pull the cover down.
4. Remove the oil drain bolt and washer from the bottom of the engine. Drain the oil into an appropriate container.

CONTINUED
5. Remove the oil filter and let the remaining oil drain. A special wrench (available from your Honda dealer) is required to remove the filter.

6. Install a new oil filter according to instructions that come with it.

7. Put a new washer on the drain bolt, then reinstall the drain bolt. Tighten it to:

   \[ 29 \text{ lbf-ft (39 Nm, 4.0 kgf-m)} \]

8. Refill the engine with the recommended oil.

   Engine oil change capacity (including filter):

   \[ 3.4 \text{ US qt (3.2 l, 2.8 Imp qt)} \]

9. Replace the engine oil fill cap. Start the engine. The oil pressure indicator light should go out within five seconds. If it does not, turn off the engine and reinspect your work.

10. Let the engine run for several minutes and check the drain bolt and oil filter for leaks.

11. Turn off the engine, let it sit for several minutes, then check the oil level. If necessary, add oil to bring the level to the upper mark on the dipstick.

12. Put the under cover back in place and reinstall the nine holding clips. Lock the clips securely by pushing on the center of each clip.

**NOTICE**

Improper disposal of engine oil can be harmful to the environment. If you change your own oil, please dispose of the used oil properly. Put it in a sealed container and take it to a recycling center. Do not discard it in a trash bin or dump it on the ground.
Adding Engine Coolant

If the coolant level in the reserve tank is at or below the MIN line, add coolant to bring it up to the MAX line. Inspect the cooling system for leaks. The coolant you add should always be a mixture of 50 percent antifreeze and 50 percent water. Never add straight antifreeze or plain water.

Always use Honda All Season Antifreeze/Coolant Type 2. This coolant is pre-mixed with 50 percent antifreeze and 50 percent water. It does not require any additional mixing. If it is not available, you may use another major-brand non-silicate coolant as a temporary replacement. Make sure it is a high-quality coolant recommended for aluminum engines. However, continued use of any non-Honda coolant can result in corrosion, causing the cooling system to malfunction or fail. Have the cooling system flushed and refilled with Honda antifreeze/coolant as soon as possible.

If the reserve tank is completely empty, you should also check the coolant level in the radiator.

**WARNING**

Removing the radiator cap while the engine is hot can cause the coolant to spray out, seriously scalding you.

Always let the engine and radiator cool down before removing the radiator cap.

1. Make sure the engine and radiator are cool.

CONTINUED
2. Turn the radiator cap counterclockwise, without pressing down on it, until it stops. This relieves any pressure remaining in the cooling system.

3. Remove the radiator cap by pushing down and turning counterclockwise.

4. The coolant level should be up to the base of the filler neck. Add coolant if it is low.

Pour the coolant slowly and carefully so you do not spill. Clean up any spills immediately. Spilled coolant could damage components in the engine compartment.

5. Put the radiator cap back on. Tighten it fully.

6. Pour coolant into the reserve tank. Fill it to halfway between the MAX and MIN marks. Put the cap back on the reserve tank.

Do not add any rust inhibitors or other additives to your car’s cooling system. They may not be compatible with the coolant or engine components.
Repeating: Replace Engine Coolant

The cooling system should be completely drained and refilled with new coolant according to the time and distance recommendations in the maintenance schedule. Only use Honda All Season Antifreeze/Coolant Type 2.

Draining the coolant requires access to the underside of the car. Unless you have the tools and knowledge, you should have this maintenance done by a skilled mechanic.

1. Turn the ignition ON (II). Turn the temperature control dial to maximum heat. Turn off the ignition. Open the hood. Make sure the engine and radiator are cool to the touch.

2. Remove the radiator cap.

3. Loosen the drain plug on the bottom of the radiator. The coolant will drain through the splash guard. Drain the coolant into an appropriate container.

CONTINUED
4. Remove the cover to access the drain bolt (see page 197). Remove the drain bolt and washer from the engine block. Drain the coolant into an appropriate container.

5. To remove the reserve tank to drain the coolant, first remove the battery. Disconnect the battery cables from the terminals. Disconnect the negative (−) cable first, then the positive (+) cable.

6. Remove the bolt and the nut with a wrench, and remove the battery plate. Pull the bottom end of the stay out of the hole, and remove the stay and the battery cover.

7. Remove the battery and the tray.

8. Remove the reserve tank mounting bolt with a wrench, then remove the coolant tube from the three clips. Remove the reserve tank from its holder and drain the coolant into an appropriate container.
If your car’s battery is disconnected or goes dead, the audio system will disable itself. The next time you turn on the radio you will see “CONTINUED” in the frequency display. Use the Preset buttons to enter the five-digit code (see page 137).

When the audio system disables itself, the clock setting will cancel. To reset the clock, refer to the Digital Clock in the audio system’s operation.

10. Reinstall the tray, battery, stay, battery case, and battery plate in the reverse order of removal. Reinstall and tighten the bolt and nut securely.

11. Reconnect the battery cables to the terminals. Connect the positive (+) cable first, then the negative (−) cable.

**WARNING:** Battery posts, terminals and related accessories contain lead and lead compounds. **Wash hands after handling.**

12. When the coolant stops draining, tighten the drain plug at the bottom of the radiator.

13. Put a new washer on the drain bolt, then reinstall the drain bolt in the engine block. Tighten it securely.

- **Tightening torque:** 58 lbf·ft (78 N·m, 8.0 kgf·m)

14. Reinstall the cover.

15. Loosen the bleeder bolt on top of the engine.
Start the engine and let it run until the radiator cooling fan comes on at least twice. Then stop the engine.

Remove the radiator cap. Fill the radiator with coolant up to the base of the filler neck.

The cooling system capacity is:

**With 5-speed manual transmission:**
1.08 US gal (4.1 l, 0.90 Imp gal)

**With continuously variable transmission (CVT):**
1.06 US gal (4.0 l, 0.88 Imp gal)

17. Tighten the bleeder bolt when coolant comes out in a steady stream with no bubbles.

18. Start the engine and let it run for about 30 seconds. Then turn off the engine.

19. Check the level in the radiator, add coolant if needed.

20. Fill the reserve tank to the MAX mark. Install the reserve tank cap.

21. Install the radiator cap, and tighten it to the first stop.

22. Start the engine and let it run until the radiator cooling fan comes on at least twice. Then stop the engine.

23. Remove the radiator cap. Fill the radiator with coolant up to the base of the filler neck.

16. Pour Honda All Season Antifreeze/Coolant Type 2 into the radiator up to the base of the filler neck. This coolant is a mixture of 50 percent antifreeze and 50 percent water. Pre-mixing is not required.
24. Start the engine and hold it at 1,500 rpm until the radiator fan comes on. Turn off the engine. Check the coolant level in the radiator and add coolant if needed.

25. Install the radiator cap, and tighten it fully.

26. If necessary, fill the reserve tank to the MAX mark. Install the reserve tank cap.

Windshield Washers
Check the level in the windshield washer reservoir at least monthly during normal usage. In bad weather, when you use the washers often, check the level every time you stop for fuel.

The windshield washer reservoir is located behind the driver's side headlight. Check the reservoir's fluid level by removing the cap and looking at the level gauge attached to the cap.

On Canadian models
The low washer level indicator will light when the level is low (see page 65).

Fill the reservoir with a good-quality windshield washer fluid. This increases the cleaning capability and prevents freezing in cold weather.
Windshield Washers, Transmission Fluid

When you refill the reservoir, clean the edges of the windshield wiper blades with windshield washer fluid on a clean cloth. This will help to condition the blade edges.

**NOTICE**

Do not use engine antifreeze or a vinegar/water solution in the windshield washer reservoir.

Antifreeze can damage your car's paint, while a vinegar/water solution can damage the windshield washer pump.

Use only commercially-available windshield washer fluid.

---

**Continuously Variable Transmission (CVT)**

Check the fluid level with the engine and transmission at normal operating temperature.

1. Park the car on level ground. Shut off the engine. For accurate results, wait at least 60 seconds, and no more than 90 seconds, after shutting off the engine to check the fluid level.

2. Remove the dipstick (yellow loop) from the transmission and wipe it with a clean cloth.
If the level is below the lower mark, add fluid into the filler hole to bring it to the upper mark.

Pour the fluid slowly and carefully so you do not spill. Clean up any spills immediately. Spilled fluid could damage components in the engine compartment.

Always use Honda ATF-Z1 (Automatic Transmission Fluid). If it is not available, you may use a DEXRON® III automatic transmission fluid as a temporary replacement. However, continued use can affect shift quality. Have the transmission flushed and refilled with Honda ATF-Z1 as soon as it is convenient.

To thoroughly flush the transmission, the technician should drain and refill it with Honda ATF-Z1, then drive the vehicle a short distance. Do this three times. Then drain and refill the transmission a final time.

6. Insert the dipstick all the way back into the transmission securely as shown in the illustration.

The transmission should be drained and refilled with new fluid according to the time and distance recommendations in the maintenance schedule.
Check the fluid level with the transmission at normal operating temperature and the car sitting on level ground. Remove the under cover to access the transmission housing (see page 197). Remove the transmission filler bolt and carefully feel inside the bolt hole with your finger. The fluid level should be up to the edge of the bolt hole. If it is not, add Honda Manual Transmission Fluid (MTF) until it starts to run out of the hole. Reinstall the filler bolt and tighten it securely.

If Honda MTF is not available, you may use an SAE 10W-30 or 10W-40 viscosity motor oil with the API Certification seal that says “For Gasoline Engines” as a temporary replacement. However, motor oil does not contain the proper additives and continued use can cause stiffer shifting. Replace as soon as it is convenient.

The transmission should be drained and refilled with new fluid according to the time and distance recommendations in the maintenance schedule.
The fluid level should be between the MIN and MAX marks on the side of the reservoir. If the level is at or below the MIN mark, your brake system needs attention. Have the brake system inspected for leaks or worn brake pads.

Check the fluid level in the reservoirs monthly. There are up to two reservoirs, depending on the model. They are:

- Brake fluid reservoir (all models)
- Clutch fluid reservoir (manual transmission only)

The brake fluid should be replaced according to the time recommendation in the maintenance schedule.

Always use Honda Heavy Duty Brake Fluid DOT 3. If it is not available, you should use only DOT 3 or DOT 4 fluid, from a sealed container, as a temporary replacement. However, the use of any non-Honda brake fluid can cause corrosion and decrease the life of the system. Have the brake system flushed and refilled with Honda Heavy Duty Brake Fluid DOT 3 as soon as possible.

Pour the fluid slowly and carefully so you do not spill. Clean up any spills immediately. Spilled fluid could damage components in the engine compartment.

Brake fluid marked DOT 5 is not compatible with your car’s braking system and can cause extensive damage.
The fluid level should be between the MIN and MAX marks on the side of the reservoir. If it is not, add brake fluid to bring it up to that level. Use the same fluid specified for the brake system.

Low fluid level can indicate a leak in the clutch system. Have this system inspected as soon as possible.
The air cleaner element should be replaced according to the distance recommendation in the maintenance schedule.

The air cleaner element is inside the air cleaner housing in the engine compartment.

To replace it:

1. Unsnap the four clips and remove the air cleaner housing cover.
2. Remove the old air cleaner element.
3. Carefully clean the inside of the air cleaner housing with a damp rag.
4. Place the new air cleaner element in the air cleaner housing.
5. Reinstall the air cleaner housing cover and snap the four clips back into place.
Clean the hood latch assembly with a mild cleaner, then lubricate it with a multipurpose grease. Lubricate all the moving parts (as shown), including the pivot. Follow the time and distance recommendations in the Maintenance Schedule. If you are not sure how to clean and grease the latch, contact your Honda dealer.
The spark plugs in your car are a special iridium-tipped design for longer life. The spark plugs should be replaced according to the distance recommendation in the maintenance schedule.

**Replacement**

1. To replace the ignition coils, remove the engine cover by pulling it straight up.

2. Loosen the two holding bolts with a wrench and remove the resonator chamber.

3. Clean up any dirt and oil that have collected around the ignition coils.
Put the new spark plug into the socket, then screw it into the hole. Screw it in by hand so you do not crossthread it.

Use a wrench to remove the nut holding the ignition coil. Remove the ignition coil by pulling it straight out.

Remove the spark plug with a five-eighths inch (16 mm) spark plug socket.

Disconnect the wire connector from the ignition coil by pushing on the lock tab and pulling on the connector. Pull on the plastic connector, not the wires.

5. Use a wrench to remove the nut holding the ignition coil. Remove the ignition coil by pulling it straight out.

6. Remove the spark plug with a five-eighths inch (16 mm) spark plug socket.

7. Put the new spark plug into the socket, then screw it into the hole. Screw it in by hand so you do not crossthread it.
8. Torque the spark plug. (If you do not have a torque wrench, tighten the spark plug two-thirds of a turn after it contacts the cylinder head.)

Tightening torque: 13 lbf-ft (18 N-m, 1.8 kgf-m)

9. Install the ignition coil. Reinstall the nut.

10. Push the wire connector onto the ignition coil. Make sure it locks in place.

11. Repeat this procedure for the other seven spark plugs.

12. Reinstall the resonator chamber. Tighten the two bolts securely on it, then install the engine cover.

NOTICE

Tighten the spark plugs carefully. A spark plug that is too loose can overheat and damage the engine. Overtightening can cause damage to the threads in the cylinder head.

Spark Plug Gap: 0.04 in (1.1 mm) ±0.1 mm
Check the condition of your car's 12 volt battery monthly. You should check the color of the test indicator window, and for corrosion on the terminals.

Check the battery condition by looking at the test indicator window on the battery. The label on the battery explains the test indicator's colors.

Check the battery terminals for corrosion (a white or yellowish powder). To remove it, cover the terminals with a solution of baking soda and water. It will bubble up and turn brown. When this stops, wash it off with plain water. Dry off the battery with a cloth or paper towel. Coat the terminals with grease to help prevent future corrosion.

**WARNING:** Battery posts, terminals and related accessories contain lead and lead compounds. **Wash hands after handling.**
If the terminals are severely corroded, clean them with baking soda and water. Then use a wrench to loosen and remove the cables from the terminals. Always disconnect the negative (−) cable first and reconnect it last. Clean the battery terminals with a terminal cleaning tool or wire brush. Reconnect and tighten the cables, then coat the terminals with grease.

If you need to connect the battery to a charger, disconnect both cables to prevent damage to the car’s electrical system.

**WARNING**

The battery gives off explosive hydrogen gas during normal operation.

A spark or flame can cause the battery to explode with enough force to kill or seriously hurt you.

Wear protective clothing and a face shield, or have a skilled mechanic do the battery maintenance.
If your car’s battery is disconnected or goes dead, the audio system will disable itself. The next time you turn on the radio you will see “ ” in the frequency display. Use the Preset buttons to enter the five-digit code (see page 137).

When the battery is disconnected, the clock setting in the audio system will be canceled. You will need to reset the clock according to the instructions of the audio system.

**NOTICE**

Charging the battery with the cables connected can seriously damage your car’s electronic controls. Detach the battery cables before connecting the battery to a charger.
Check the condition of the wiper blades at least every six months. Look for signs of cracking in the rubber, or areas that are getting hard. Replace the blades if you find these signs, or if they leave streaks and unwiped areas when used.

To replace the blade:

1. Raise the wiper arm off the windshield.

2. Disconnect the blade assembly from the wiper arm by pushing in the lock tab. Hold it in while you push the blade assembly toward the base of the arm.
3. Remove the blade from its holder by grasping the tabbed end of the blade. Pull firmly until the tabs come out of the holder.

4. Examine the new wiper blades. If they have no plastic or metal reinforcement along the back edge, remove the metal reinforcement strips from the old wiper blade and install them in the slots along the edge of the new blade.

5. Slide the new wiper blade into the holder until the tabs lock.

6. Slide the wiper blade assembly onto the wiper arm. Make sure it locks in place.

7. Lower the wiper arm down against the windshield.
Periodically check the engine's radiator and air conditioning condenser for leaves, insects, and dirt stuck to the front surface. These block the air flow and reduce cooling efficiency. Use a light spray from a hose or a soft brush to remove them.

If the air conditioning does not get as cold as before, have your dealer check the system. Recharge the system with Refrigerant HFC-134a (R-134a). (See Specifications on page 289.)

Run the air conditioning at least once a week during the cold weather months. Run it for at least ten minutes while you are driving at a steady speed with the engine at normal operating temperature. This circulates the lubricating oil contained in the refrigerant.

If the air conditioning does not get as cold as before, have your dealer check the system. Recharge the system with Refrigerant HFC-134a (R-134a). (See Specifications on page 289.)

**NOTICE**

The condenser and radiator fins bend easily. Only use a low-pressure spray or soft-bristle brush to clean them.

Run the air conditioning at least once a week during the cold weather months. Run it for at least ten minutes while you are driving at a steady speed with the engine at normal operating temperature. This circulates the lubricating oil contained in the refrigerant.

Whenever you have the air conditioning system serviced, make sure the service facility uses a refrigerant recycling system. This system captures the refrigerant for reuse. Releasing refrigerant into the atmosphere can damage the environment.

Your car's air conditioning is a sealed system. Any major maintenance, such as recharging, should be done by a qualified mechanic. You can do a couple of things to make sure the air conditioning works efficiently.
Dust and Pollen Filter

The dust and pollen filter removes pollen and dust that is brought in from the outside through the heating and cooling system.

This filter should be replaced every 30,000 miles (48,000 km) under normal conditions. It should be replaced every 15,000 miles (24,000 km) if you drive primarily in urban areas that have high concentrations of soot in the air from industry and diesel-powered vehicles. Replace it more often if air flow from the heating and cooling system becomes less than usual.

To replace it:

1. Open the glove box. Remove the hooks on the side panels by pulling out on the tabs. Pivot the glove box out of the way.

2. Remove the dust and pollen filter cover by pushing in on the lock tab, then pulling the cover toward you.

The dust and pollen filter is located behind the glove box.
3. Remove the first filter by pulling it straight out of the air conditioning unit. Remove the second filter by sliding it to the left, then pulling it out.

4. Remove the old filter from the filter case.

5. Install the new filter in the case. Make sure the “AIR FLOW” arrows on the filter and the filter case face the same direction.

6. Install the dust and pollen filters into the air conditioning unit. Make sure the “AIR FLOW” arrows on the filter point downward.

7. Reinstall the dust and pollen filter cover.

8. Pivot the glove box up into position. Reinstall the hooks into the side panel of the glove box. Close the glove box.

If you are not sure how to replace the dust and pollen filters, have them replaced by your Honda dealer.
Check the condition of the drive belt. Examine the edges of the belt for cracks or fraying.

Check the tension of the belt by pushing on it with your thumb midway between the pulleys.

The belt should have the following “play” or deflection.

Compressor belt:
0.49 – 0.63 in (12.5 – 16.0 mm)

If you see signs of wear or looseness, have your dealer adjust or replace the belt.
To safely operate your car, your tires must be the proper type and size, in good condition with adequate tread, and correctly inflated. The following pages give more detailed information on how and when to check air pressure, how to inspect your tires for damage and wear, and what to do when your tires need to be replaced.

**WARNING**

Using tires that are excessively worn or improperly inflated can cause a crash in which you can be seriously hurt or killed.

Follow all instructions in this owner's manual regarding tire inflation and maintenance.

### Inflation

Keeping the tires properly inflated provides the best combination of handling, tread life, and riding comfort. Underinflated tires wear unevenly, adversely affect handling and fuel economy, and are more likely to fail from being overheated. Overinflated tires can make your car ride more harshly, are more prone to damage from road hazards, and wear unevenly.

We recommend that you visually check your tires every day. If you think a tire might be low, check it immediately with a tire gauge.

Use a gauge to measure the air pressure at least once a month. Even tires that are in good condition may lose one to two psi (10 to 20 kPa, 0.1 to 0.2 kgf/cm²) per month. Remember to check the spare tire at the same time you check all the other tires.

Check the pressure in the tires when they are cold. This means the car has been parked for at least three hours. If you have to drive the car before checking the tire pressure, the tires can still be considered “cold” if you drive less than 1 mile (1.6 km).

If you check the pressure when the tires are hot (the car has been driven several miles), you will see readings 4 to 6 psi (30 to 40 kPa, 0.3 to 0.4 kgf/cm²) higher than the cold reading. This is normal. Do not let air out to match the specified cold pressure. The tire will be underinflated.

CONTINUED
You should get your own tire pressure gauge and use it whenever you check your tire pressures. This will make it easier for you to tell if a pressure loss is due to a tire problem and not due to a variation between gauges.

**Recommended Tire Pressures for Normal Driving**

The following chart shows the recommended cold tire pressures for most normal driving conditions and speeds.

<table>
<thead>
<tr>
<th>Tire Size</th>
<th>Cold Tire Pressure for Normal Driving</th>
</tr>
</thead>
<tbody>
<tr>
<td>P185/70R14 87S</td>
<td>30 psi (210 kPa, 2.1 kgf/cm²)</td>
</tr>
</tbody>
</table>

The compact spare tire pressure is: 60 psi (420 kPa, 4.2 kgf/cm²)

These pressures are also given on the tire information label on the driver’s doorjamb.

Tubeless tires have some ability to self-seal if they are punctured. However, because leakage is often very slow, you should look closely for punctures if a tire starts losing pressure.

**Tire Pressure Adjustment for High Speed Driving**

Honda strongly recommends that you not drive faster than posted speed limits and conditions allow. If you decide it is safe to drive at high speeds, be sure to adjust the cold tire pressures as shown in the next column. If you do not adjust the tire pressure, excessive heat can build up and cause sudden tire failure.

<table>
<thead>
<tr>
<th>Tire Size</th>
<th>Cold Tire Pressure for Speeds over 100 mph (160 km/h)</th>
</tr>
</thead>
<tbody>
<tr>
<td>P185/70R14 87S</td>
<td>35 psi (240 kPa, 2.4 kgf/cm²)</td>
</tr>
</tbody>
</table>

When you return to normal speed driving, be sure to readjust the tire pressure for normal driving. You should wait until the tires are cold before adjusting the tire pressure.
**Inspection**

Every time you check inflation, you should also examine the tires for damage, foreign objects, and wear.

You should look for:

- Bumps or bulges in the tread or side of the tire. Replace the tire if you find either of these conditions.

- Cuts, splits, or cracks in the side of the tire. Replace the tire if you can see fabric or cord.

- Excessive tread wear.

**Maintenance**

In addition to proper inflation, correct wheel alignment helps to decrease tire wear. If you find a tire is worn unevenly, have your dealer check the wheel alignment.

The tires were properly balanced by the factory. They may need to be rebalanced at some time before they are worn out. Have your dealer check the tires if you feel a consistent vibration while driving. A tire should always be rebalanced if it is removed from the wheel for repair.
Make sure the installer balances the wheels when you have new tires installed. This increases riding comfort and tire life. Your car’s original tires were dynamic or “spin” balanced at the factory. For best results, have the installer perform a dynamic balance.

**NOTICE**

*Improper wheel weights can damage your vehicle’s aluminum wheels. Use only genuine Honda wheel weights for balancing.*

To help increase tire life and distribute wear more evenly, you should have the tires rotated every 10,000 miles (16,000 km). Move the tires to the positions shown in the chart each time they are rotated.

When shopping for replacement tires, you may find that some tires are “directional.” This means they are designed to rotate only in one direction. If you use directional tires, they should be rotated only front-to-back.
Replacing Tires and Wheels
The tires that came with your car were selected to match the performance capabilities of the car while providing the best combination of handling, ride comfort, and long life. You should replace them with radial tires of the same size, load range, speed rating, and maximum cold tire pressure rating (as shown on the tire’s sidewall). Mixing radial and bias-ply tires on your car can reduce its braking ability, traction, and steering accuracy.

⚠️ WARNING ⚠️
Installing improper tires on your car can affect handling and stability. This can cause a crash in which you can be seriously hurt or killed.

Always use the size and type of tires recommended in this owner’s manual.

It is best to replace all four tires at the same time. If that is not possible or necessary, then replace the two front tires or the two rear tires as a pair. Replacing just one tire can seriously affect your car’s handling.

The ABS works by comparing the speed of the wheels. When replacing tires, use the same size originally supplied with the car. Tire size and construction can affect wheel speed and may cause the system to work inconsistently.

If you ever need to replace a wheel, make sure the wheel’s specifications match those of the original wheel that came on your car. Replacement wheels are available at your Honda dealer.
Wheels: 14 x 5 1/2 JJ

Tires: P185/70R14 87S

See page 290 for information about DOT Tire Quality Grading.

**Winter Driving**

Tires that are marked “M+S” or “All Season” on the sidewall have an all-weather tread design. They should be suitable for most winter driving conditions. Tires without these markings are designed for optimum traction in dry conditions. They may not provide adequate performance in winter driving. For the best performance in snowy or icy conditions, you should install snow tires or tire chains. They may be required by local laws under certain conditions.

**Snow Tires**

If you mount snow tires on your Honda, make sure they are radial tires of the same size and load range as the original tires. Mount snow tires on all four wheels to balance your car’s handling in all weather conditions. Keep in mind the traction provided by snow tires on dry roads may not be as high as your car’s original equipment tires. You should drive cautiously even when the roads are clear. Check with the tire dealer for maximum speed recommendations.
**Tire Chains**

Because your Honda has limited tire clearance, mount only SAE Class “S” cable-type traction devices on the front tires. Use traction devices only when required by driving conditions or local laws. Make sure they are the correct size for your tires.

Metal link-type “chains” should not be used. No matter how tight they seem to be installed, they can come into contact with the body and suspension, causing serious damage.

When installing cables, follow the manufacturer’s instructions and mount them as tightly as you can. Drive slowly with them installed. If you hear them coming in contact with the body or chassis, stop and investigate. Make sure the cables are installed tightly, and that they are not contacting the brake lines or suspension. Remove them as soon as you begin driving on cleared roads.

---

**NOTICE**

Traction devices that are the wrong size or improperly installed can damage your vehicle’s brake lines, suspension, body, and wheels. Stop driving if they are hitting any part of the vehicle.
Check the operation of your car’s exterior lights at least once a month. A burned out bulb can create an unsafe condition by reducing your car’s visibility and the ability to signal your intentions to other drivers.
Check the following:

- Headlights (low and high beam)
- Parking lights
- Taillights
- Brake lights
- High-mount brake light
- Turn signals
- Back-up lights
- Hazard light function
- License plate lights
- Side marker lights
- Daytime running lights
  (Canadian models)

If you find any bulbs are burned out, replace them as soon as possible. Refer to the chart on page 289 to determine what type of replacement bulb is needed.
Headlight Aiming
The headlights were properly aimed when your car was new. If you regularly carry heavy items in the trunk, readjustment may be required. Adjustment of the headlights should be performed by a Honda technician or other qualified mechanic.

Replacing a Headlight Bulb
Your car has halogen headlight bulbs, one on each side. When replacing a bulb, handle it by its steel base and protect the glass from contact with your skin or hard objects. If you touch the glass, clean it with denatured alcohol and a clean cloth.

**NOTICE**
Halogen headlight bulbs get very hot when lit. Oil, perspiration, or a scratch on the glass can cause the bulb to overheat and shatter.

1. Open the hood.
If you need to change the headlight bulb on the driver’s side, remove the holding clip from the stay with a flat-tipped screwdriver, then remove the upper part of the washer fluid reservoir tank by pulling it out.
If you are changing the bulb on the driver's side, start the engine, turn the steering wheel all the way to the right, and turn off the engine. If you are changing the bulb on the passenger's side, turn the steering wheel to the left.

1. If you are changing the bulb on the driver's side, start the engine, turn the steering wheel all the way to the right, and turn off the engine. If you are changing the bulb on the passenger’s side, turn the steering wheel to the left.

2. Remove the electrical connector from the bulb by pulling the connector straight back.

3. Remove the rubber weather seal by pulling on the tab.

4. Unclip the end of the hold-down wire from its slot. Pivot it out of the way and remove the bulb.

5. Insert the new bulb into the hole, making sure the tabs are in their slots. Pivot the hold-down wire back in place and clip the end into the slot.

6. Install the rubber seal over the back of the headlight assembly. Make sure it is right side up; it is marked “TOP.”

7. Push the electrical connector onto the new bulb. Make sure it is connected securely. Turn on the headlights to test the new bulb.

8. (Driver’s side) Reinstall the upper part of the windshield washer reservoir. Install the holding clip on the stay and lock it by pushing on the center of clip.

Replacing the Front Side Marker/Turn Signal and Parking Light Bulbs

5. Insert the new bulb into the hole, making sure the tabs are in their slots. Pivot the hold-down wire back in place and clip the end into the slot.

6. Install the rubber seal over the back of the headlight assembly. Make sure it is right side up; it is marked “TOP.”

7. Push the electrical connector onto the new bulb. Make sure it is connected securely. Turn on the headlights to test the new bulb.

8. (Driver’s side) Reinstall the upper part of the windshield washer reservoir. Install the holding clip on the stay and lock it by pushing on the center of clip.
2. Use a flat-tipped screwdriver to remove the holding clip from the inner fender.

3. Pull the inner fender cover back.

4. Remove the socket from the headlight assembly by turning it one-quarter turn counterclockwise.

5. Pull the bulb straight out of its socket. Push the new bulb straight into the socket until it bottoms.

6. Insert the socket back into the headlight assembly. Turn it clockwise to lock it in place.

7. Test the lights to make sure the new bulb is working.

8. Put the inner fender cover in place. Install the holding clip. Lock it in place by pushing on the center.
Replacing Rear Bulbs (in Fenders)

1. Open the trunk.

   Remove the screws in the center of each of the two fasteners on the side of the trunk lining. Pull the lining back.

2. Determine which of the two bulbs is burned out: stop/taillight/side marker light or turn signal light.

3. Remove the socket by turning it one-quarter turn counterclockwise.

4. Pull the bulb straight out of its socket. Push the new bulb straight into the socket until it bottoms.

5. Reinstall the socket into the light assembly by turning it clockwise until it locks.

6. Test the lights to make sure the new bulb is working.

7. Reinstall the trunk lining. Make sure it is installed under the edge of the trunk seal.

8. Put the fasteners into the holes on the side of the trunk lining. Reinstall the screws.
Replacing Rear Bulbs (in Trunk Lid)

1. Open the trunk.
2. Determine which of the two bulbs is burned out: taillight or back-up light.
3. Remove the socket by turning it one-quarter turn counterclockwise.
4. Pull the bulb straight out of its socket. Push the new bulb straight into the socket until it bottoms.
5. Insert the socket back into the light assembly. Turn it clockwise to lock it in place.
6. Test the lights to make sure the new bulb is working.

Replacing a High-mount Brake Light Bulb

1. Open the trunk and remove the socket from the light assembly by turning it one-quarter turn counterclockwise.
2. Pull the bulb straight out of its socket. Push the new bulb straight into the socket until it bottoms.
3. Reinstall the socket. Turn it clockwise until it locks. Make sure the new bulb is working.

4. Turn on the parking lights and check that the new bulb is working.

5. Reinstall the socket back in place by pushing it in until it latches.

1. Open the trunk.

2. Remove the socket from the light assembly by squeezing the tabs on both sides of the socket.

3. Pull the bulb straight out of its socket. Push the new bulb in until it bottoms in the socket.

Replacing a Rear License Plate Bulb
Replacing the Trunk Light Bulb

1. Open the trunk. Put a cloth on the left side edge of the trunk light assembly. Remove the trunk light assembly by using a small flat-tipped screwdriver to pry carefully on the left edge of the assembly.

2. Pull the bulb straight out of the holder. Push the new bulb straight into the holder until it bottoms.

3. Put the light assembly back into the hole, right side first. Push on the left side until it snaps into place.
Replacing Bulbs in the Interior Lights
Although the ceiling light and spotlights come apart the same way, they do not use the same type of bulbs.

1. Remove the lens by carefully prying on the edge of the lens with a fingernail file or a small flat-tip screwdriver. Do not pry on the edge of the housing around the lens.

Ceiling light:
Pry on the side edge of the lens in the middle.

2. Remove the bulb by pulling it straight out of its metal tabs.

3. Push the new bulb into the metal tabs. Snap the lens back in place.

CONTINUED
Spotlights:
1. Check which bulb is burned out. Push on the lens of the opposite side you are replacing.
2. Remove the lens of the burned out bulb by carefully prying on the edge between the lenses with a fingernail file or a small flat-tipped screwdriver.

3. Remove the bulb by pulling it straight out of the bulb holder.
4. Push the new bulb into the bulb holder.
5. Reinstall the lens by inserting the outside edge first, then pushing on the inside edge.
If you need to park your car for an extended period (more than one month), there are several things you should do to prepare it for storage. Proper preparation helps prevent deterioration and makes it easier to get your car back on the road. If possible, store your car indoors.

- Fill the fuel tank.
- Change the engine oil and filter (see page 197).
- Wash and dry the exterior completely.
- Clean the interior. Make sure the carpeting, floor mats, etc. are completely dry.
- Leave the parking brake off. Put the transmission in Reverse (5-speed manual) or Park (CVT).
- Block the rear wheels.
- If the car is to be stored for a longer period, it should be supported on jackstands so the tires are off the ground.
- Leave one window open slightly (if the car is being stored indoors).
- Disconnect the 12 volt battery.
- Support the front wiper blade arms with a folded towel or rag so they do not touch the windshield.
- To minimize sticking, apply a silicone spray lubricant to all door and trunk seals. Also, apply a vehicle body wax to the painted surfaces that mate with the door and trunk seals.
- Cover the car with a “breathable” cover, one made from a porous material such as cotton. Nonporous materials, such as plastic sheeting, trap moisture, which can damage the paint.
- Reconnect the 12 volt battery and drive your car every month for about 30 minutes. This will keep the IMA battery charged and in good condition.

If you store your car for 12 months or longer, have your Honda dealer perform the inspections called for in the 24 months maintenance schedule (Normal Conditions) as soon as you take it out of storage (see page 186). The replacements called for in the maintenance schedule are not needed unless the car has actually reached that time or mileage.
Regular cleaning and polishing of your Honda helps to keep it “new” looking. This section gives you hints on how to clean your car and preserve its appearance: the paint, brightwork, wheels and interior. Also included are several things you can do to help prevent corrosion.

Appearance Care  245
**Washing**

Frequent washing helps preserve your car’s beauty. Dirt and grit can scratch the paint, while tree sap and bird droppings can permanently ruin the finish.

Wash your car in a shady area, not in direct sunlight. If the car is parked in the sun, move it into the shade and let the exterior cool down before you start.

Only use the solvents and cleaners recommended in this Owner’s Manual.

---

*Notice*

*Chemical solvents and strong cleaners can damage the paint, metal, and plastic on your car.*

- Rinse the car thoroughly with cool water to remove loose dirt.
- Fill a bucket with cool water. Mix in a mild detergent, such as dishwashing liquid or a product made especially for car washing.
- Wash the car using the water and detergent solution and a soft-bristle brush, sponge, or soft cloth. Start at the top and work your way down. Rinse frequently.
- Check the body for road tar, tree sap, etc. Remove these stains with tar remover or turpentine. Rinse it off immediately so it does not harm the finish. Remember to re-wax these areas, even if the rest of the car does not need waxing.
- When you have washed and rinsed the whole exterior, dry it with a chamois or soft towel. Letting it air-dry will cause dulling and water spots.

As you dry the car, inspect it for chips and scratches that could allow corrosion to start. Repair them with touch-up paint (see page 248).
Roof Antenna

Before using an automatic car wash, remove the radio antenna so it does not get damaged. Remove the antenna by unscrewing it. When you reinstall the antenna, tighten it securely.

Before entering or parking in areas with low ceiling height, push the antenna down.

Waxing

Always wash and dry the whole car before waxing it. You should wax your car, including the metal trim, whenever water sits on the surface in large patches. It should form into beads or droplets after waxing.

You should use a quality liquid or paste wax. Apply it according to the instructions on the container. In general, there are two types of products:

Waxes — A wax coats the finish and protects it from damage by exposure to sunlight, air pollution, etc. You should use a wax on your Honda when it is new.

Polishes — Polishes and cleaner/waxes can restore the shine to paint that has oxidized and lost some of its shine. They normally contain mild abrasives and solvents that remove the top layer of the finish. You should use a polish on your Honda if the finish does not have its original shine after using a wax.

Cleaning tar, insects, etc. with removers also takes off the wax. Remember to re-wax those areas, even if the rest of the car does not need waxing.

Appearance Care 247
Aluminum Wheels
Clean your Honda’s aluminum alloy wheels as you do the rest of the exterior. Wash them with the same solution, and rinse them thoroughly.

The wheels have a protective clear-coat that keeps the aluminum from corroding and tarnishing. Using harsh chemicals, including some commercial wheel cleaners, or stiff brushes can damage this clear-coat. Only use a mild detergent and soft brush or sponge to clean the wheels.

Paint Touch-up
Your dealer has touch-up paint to match your car’s color. The color code is printed on a sticker on the driver’s doorjamb. Take this code to your dealer so you are sure to get the correct color.

Inspect your car frequently for chips or scratches in the paint. Repair them right away to prevent corrosion of the metal underneath. Use the touch-up paint only on small chips and scratches. More extensive paint damage should be repaired by a professional.
Carpeting
Vacuum the carpeting frequently to remove dirt. Ground-in dirt will make the carpet wear out faster. Periodically shampoo the carpet to keep it looking new. Use one of the foam-type carpet cleaners on the market. Follow the instructions that come with the cleaner, applying it with a sponge or soft brush. Keep the carpeting as dry as possible by not adding water to the foam.

Floor Mats
If equipped

The Honda driver’s floor mat was designed to hook over the floor mat anchors. This keeps the floor mat from sliding forward and possibly interfering with the pedals.

If you remove the floor mat, make sure to re-anchor it when you put it back in your car.

If you replace it, use a Honda floor mat that is designed to be used with the floor mat anchors in your car.

If you use a non-Honda floor mat in the driver’s footwell, make sure it fits properly and that it can be used with the floor mat anchor.

Do not put additional floor mats on top of the anchored mat, otherwise the additional mats may slide forward and interfere with the pedals.

If equipped

Carpeting Floor Mats

Interior Care

Appearance Care  249
Fabric
Vacuum dirt and dust out of the material frequently. For general cleaning, use a solution of mild soap and lukewarm water, letting it air dry. To clean off stubborn spots, use a commercially-available fabric cleaner. Test it on a hidden area of the fabric first, to make sure it does not bleach or stain the fabric. Follow the instructions that come with the cleaner.

Vinyl
Remove dirt and dust with a vacuum cleaner. Wipe the vinyl with a soft cloth dampened in a solution of mild soap and water. Use the same solution with a soft-bristle brush on more difficult spots. You can also use commercially-available spray or foam-type vinyl cleaners.

Seat Belts
If your seat belts get dirty, you can use a soft brush with a mixture of mild soap and warm water to clean them. Do not use bleach, dye, or cleaning solvents. They can weaken the belt material. Let the belts air-dry before you use the car.

Dirt build-up in the loops of the seat belt anchors can cause the belts to retract slowly. Wipe the insides of the loops with a clean cloth dampened in mild soap and warm water or isopropyl alcohol.
Windows
Clean the windows, inside and out, with a commercially-available glass cleaner. You can also use a mixture of one part white vinegar to ten parts water. This will remove the haze that builds up on the inside of the windows. Use a soft cloth or paper towels to clean all glass and clear plastic surfaces.

**NOTICE**

*The rear window defogger wires are bonded to the inside of the glass. Wiping vigorously up-and-down can dislodge and break the defogger wires. When cleaning the rear window, use gentle pressure and wipe side-to-side.*

Air Fresheners
If you want to use an air freshener/deodorizer in the interior of your car, it is best to use a solid type. Some liquid air fresheners contain chemicals that may cause parts of the interior trim and fabric to crack or discolor.

If you use a liquid air freshener, make sure you fasten it securely so it does not spill as you drive.
Two factors normally contribute to causing corrosion in your car:

1. Moisture trapped in body cavities. Dirt and road salt that collects in hollows on the underside of the car stays damp, promoting corrosion in that area.

2. Removal of paint and protective coatings from the exterior and underside of the car.

Many corrosion-preventive measures are built into your Honda. You can help keep your car from corroding by performing some simple periodic maintenance:

- Repair chips and scratches in the paint as soon as you discover them.
- Inspect and clean out the drain holes in the bottom of the doors and body.
- Check the floor coverings for dampness. Carpeting and floor mats may remain damp for a long time, especially in winter. This dampness can eventually cause the floor panels to corrode.

- Use a high-pressure spray to clean the underside of your car. This is especially important in areas that use road salt in winter. It is also a good idea in humid climates and areas subject to salt air. Cars equipped with ABS have a sensor and wiring at each wheel. Be careful not to damage them.
- Have the corrosion-preventive coatings on the underside of your car inspected and repaired periodically.
Body repairs can affect your car's resistance to corrosion. If your car needs repairs after a collision, pay close attention to the parts used in the repair and the quality of the work.

Make sure the repair facility uses Honda replacement body parts. Some companies make sheet metal pieces that seem to duplicate the original Honda body parts, but are actually inferior in fit, finish, and corrosion resistance. Once installed, they do not give the same high-quality appearance.

When reporting your collision to the insurance company, tell them you want Honda parts used in the repair. Although most insurers recognize the quality of original parts, some may try to specify that the repairs be done with other available parts. You should investigate this before any repairs have begun.

Take your car to your authorized Honda dealer for inspection after the repairs are completed. Your dealer can make sure that quality materials were used, and that corrosion-preventive coatings were applied to all repaired and replaced parts.
This section covers the more common problems that motorists experience with their vehicles. It gives you information about how to safely evaluate the problem and what to do to correct it. If the problem has stranded you on the side of the road, you may be able to get going again. If not, you will also find instructions on getting your car towed.

- Compact Spare Tire ......................... 256

- Charging System Indicator .......... 272
- Malfunction Indicator Lamp ........... 273
  - Readiness Codes ......................... 274
- Brake System Indicator .............. 275
- Fuses ......................................... 276
- Checking and Replacing ................. 277
- Emergency Towing ...................... 282
Follow these precautions whenever you are using the compact spare tire:

- Do not exceed 50 mph (80 km/h) under any circumstances.
- This tire gives a harsher ride and less traction on some road surfaces than the regular tire. Use greater caution while driving on this tire.
- Do not mount snow chains on the compact spare.
- The wheel of the compact spare tire is designed especially to fit your car. Do not use your spare tire on another vehicle unless it is the same make and model.

Your car has a compact spare tire that takes up less space. Use this spare tire as a temporary replacement only. Get your regular tire repaired or replaced and put it back on your car as soon as you can.

Check the inflation pressure of the compact spare tire every time you check the other tires. It should be inflated to:

60 psi (420 kPa, 4.2 kgf/cm²)

The compact spare tire has a shorter tread life than a regular tire. Replace it when you can see the tread wear indicator bars. The replacement should be the same size and design tire, mounted on the same wheel. The compact spare tire is not designed to be mounted on a regular wheel, and the compact wheel is not designed for mounting a regular tire.
If you have a flat tire while driving, stop in a safe place to change it. Stopping in traffic or on the shoulder of a busy road is dangerous. Drive slowly along the shoulder until you get to an exit or an area to stop that is far away from the traffic lanes.

**WARNING**

The car can easily roll off the jack, seriously injuring anyone underneath.

Follow the directions for changing a tire exactly, and never get under the car when it is supported only by the jack.

1. Park the car on firm, level and non-slippery ground away from traffic. Put the transmission in Park (automatic) or Reverse (manual). Apply the parking brake.

2. Turn on the hazard warning lights and turn the ignition switch to LOCK (0). Have all the passengers get out of the car while you change the tire.
3. Open the trunk. Raise the trunk floor mat and the trunk floor by lifting up on the back edge.

4. Take the tool kit out of the trunk.

5. Unscrew the wing bolt and take the spare tire out of its well.

6. Turn the jack’s end bracket counterclockwise to loosen it, then remove the jack.

7. Loosen the four wheel nuts 1/2 turn with the wheel wrench.
Use the extension and wheel wrench as shown to raise the car until the flat tire is off the ground.

Find the jacking point nearest the wheel you are removing. Place the jack under the jacking point. Turn the end bracket clockwise until the top of the jack contacts the jacking point. Make sure the jacking point tab is resting in the jack notch.

Remove the wheel nuts, then remove the flat tire. Temporarily place the flat tire on the ground with the outside surface of the wheel facing up. You could scratch the wheel if you put it face down.

CONTINUED
11. Before mounting the spare tire, wipe any dirt off the mounting surface of the wheel and hub with a clean cloth. Wipe the hub carefully, it may be hot from driving.

12. Put the wheel nuts back on finger-tight, then tighten them in a crisscross pattern with the wheel wrench until the wheel is firmly against the hub. Do not try to tighten them fully.

13. Lower the car to the ground and remove the jack.
14. Tighten the wheel nuts securely in the same crisscross pattern. Have the wheel nut torque checked at the nearest automotive service facility. Tighten the wheel nuts to: 80 lbf-ft (108 N·m, 11 kgf·m)

15. Remove the center cap before storing the flat tire in the spare tire well.

16. Place the flat tire face down in the spare tire well.

17. Wrap the spacer cone and spare tire wing bolt with cloth or paper and store them in the spare tire well.
18. Store the jack in the trunk with the end bracket on the left side. Turn the jack's end bracket to lock it in place. Store the tool kit.

**WARNING**

Loose items can fly around the interior in a crash and could seriously injure the occupants.

Store the wheel, jack, and tools securely before driving.

19. Store the center cap in the trunk. Make sure it does not get scratched or damaged.

20. Lower the trunk floor and trunk floor mat, then close the trunk lid.
Diagnosing why your engine won’t start falls into two areas, depending on what you hear when you turn the key to START (III):

- You hear nothing, or almost nothing. The engine’s starter motor does not operate at all, or operates very slowly.
- You can hear the starter motor operating normally, or the starter motor sounds like it is spinning faster than normal, but the engine does not start up and run.

Nothing Happens or the Starter Motor Operates Very Slowly
When you turn the ignition switch to START (III), you do not hear the normal noise of the engine trying to start. You may hear a clicking sound or series of clicks, or nothing at all. Check these things:

- Check the transmission interlock. If you have a manual transmission, the clutch pedal must be pushed all the way to the floor or the starter will not operate. With an automatic transmission, it must be in Park or Neutral.
- Turn the ignition switch to ON (II). Turn on the headlights and check their brightness. If the headlights are very dim or don’t light at all, the battery is discharged. See Jump Starting on page 265.
- Turn the ignition switch to START (III). If the headlights do not dim, check the condition of the fuses. If the fuses are OK, there is probably something wrong with the electrical circuit for the ignition switch or starter motor. You will need a qualified technician to determine the problem. (See Emergency Towing on page 282.)

If the headlights dim noticeably or go out when you try to start the engine, either the battery is discharged or the connections are corroded. Check the condition of the battery and terminal connections (see page 216). You can then try jump starting the car from a booster battery (see page 265).

CONTINUED
The Starter Operates Normally

In this case, the starter motor’s speed sounds normal, or even faster than normal, when you turn the ignition switch to START (III), but the engine does not run.

- Your car has the Immobilizer System. You should use a properly-coded master or valet key to start the engine (see page 84). A key that is not properly coded will cause the immobilizer system indicator in the dash panel to blink rapidly.

- Are you using the proper starting procedure? Refer to Starting the Engine on page 161.

- Do you have fuel? Turn the ignition switch to ON (II) for a minute and watch the fuel gauge. The low fuel level warning light may not be working, so you were not reminded to fill the tank.

- There may be an electrical problem, such as no power to the fuel pump. Check all the fuses (see page 277).

If you find nothing wrong, you will need a qualified technician to find the problem. See Emergency Towing on page 282.
To jump start your car, follow these directions closely:

1. Open the hood and check the physical condition of the battery (see page 216). In very cold weather, check the condition of the electrolyte. If it seems slushy or like ice, do not try jump starting until it thaws.

**WARNING**

A battery can explode if you do not follow the correct procedure, seriously injuring anyone nearby.

Keep all sparks, open flames, and smoking materials away from the battery.

You cannot start a Honda with an automatic transmission (CVT) by pushing or pulling it.

**NOTICE**

If a battery sits in extreme cold, the electrolyte inside can freeze. Attempting to jump start with a frozen battery can cause it to rupture.

2. Turn off all the electrical accessories: heater, A/C, stereo system, lights, etc. Put the transmission in Neutral or Park, and set the parking brake.

CONTINUED
3. Connect one jumper cable to the positive (+) terminal on your Honda’s battery. Connect the other end to the positive (+) terminal on the booster battery.

4. Connect the second jumper cable to the negative (−) terminal on the booster battery. Connect the other end to the metal projection on the side mount behind the passenger side headlight as shown. Do not connect this jumper cable to any other part of the engine.

The numbers in the illustration show you the order to connect the jumper cables.

5. If the booster battery is in another vehicle, have an assistant start that vehicle and run it at a fast idle.
6. Start your car. If the starter motor still operates slowly, check the jumper cable connections to make sure they have good metal-to-metal contact.

7. Once your car is running, disconnect the negative cable from your car, then from the booster battery. Disconnect the positive cable from your car, then the booster battery.

Keep the ends of the jumper cables away from each other and any metal on the car until all are disconnected. Otherwise, you may cause an electrical short.

If your car’s 12 volt battery is disconnected or goes dead, the IMA battery level gauge reading may not be correct the next time you turn the ignition switch to ON (II). It may show less than the actual level temporarily. It will show the correct level after you drive for at least 30 minutes.
The reading on your car’s temperature gauge should stay in the midrange under most conditions. It may go higher if you are driving up a long steep hill on a very hot day. If it climbs to the red mark, you should determine the reason.

**NOTICE**

Driving with the temperature gauge reading at the red mark can cause serious damage to your engine.

Your car can overheat for several reasons, such as lack of coolant or a mechanical problem. The only indication may be the temperature gauge climbing to or above the red mark. Or you may see steam or spray coming from under the hood. In either case, you should take immediate action.

**WARNING**

Steam and spray from an overheated engine can seriously scald you.

Do not open the hood if steam is coming out.

1. Safely pull to the side of the road. Put the transmission in Neutral or Park, and set the parking brake. Turn off the heating and cooling system and all other accessories. Turn on the hazard warning indicators.

2. If you see steam and/or spray coming from under the hood, turn off the engine.
If you do not see steam or spray, leave the engine running and watch the temperature gauge. If the high heat is due to overloading (climbing a long, steep hill on a hot day with the A/C running, for example), the engine should start to cool down almost immediately. If it does, wait until the temperature gauge comes down to the midpoint then continue driving.

If the temperature gauge stays at the red mark, turn off the engine. Wait until you see no more signs of steam or spray, then open the hood.

6. Look for any obvious coolant leaks, such as a split radiator hose. Everything is still extremely hot, so use caution. If you find a leak, it must be repaired before you continue driving (see Emergency Towing on page 282).

7. If you don’t find an obvious leak, check the coolant level in the radiator reserve tank (see page 149). If the level is below the MIN mark, add coolant to halfway between the MIN and MAX marks.

8. If there was no coolant in the reserve tank, you may also have to add coolant to the radiator. Let the engine cool down until the reading reaches the middle of the temperature gauge, or lower, before checking the radiator.

**WARNING**
Removing the radiator cap while the engine is hot can cause the coolant to spray out, seriously scalding you.

Always let the engine and radiator cool down before removing the radiator cap.

**CONTINUED**
9. Using gloves or a large heavy cloth, turn the radiator cap counterclockwise, without pushing down, to the first stop. This releases any remaining pressure in the cooling system. After the pressure releases, push down on the cap and turn it until it comes off.

10. Start the engine and set the temperature control dial to maximum. Add coolant to the radiator up to the base of the filler neck. If you do not have the proper coolant mixture available, you can add plain water. Remember to have the cooling system drained and refilled with the proper mixture as soon as you can.

11. Put the radiator cap back on tightly. Run the engine and watch the temperature gauge. If it goes back to the red mark, the engine needs repair. (See Emergency Towing on page 282.)

12. If the temperature stays normal, check the coolant level in the radiator reserve tank. If it has gone down, add coolant to the MAX mark. Put the cap back on tightly.
This indicator should light when the ignition switch is ON (II), and go out after the engine starts. It should never come on when the engine is running. If it starts flashing, it indicates that the oil pressure dropped very low for a moment, then recovered. If the indicator stays on with the engine running, it shows that the engine has lost oil pressure and serious engine damage is possible. In either case, you should take immediate action.

**NOTICE**

Running the engine with low oil pressure can cause serious mechanical damage almost immediately. Turn off the engine as soon as you can safely get the car stopped.

1. Safely pull off the road and shut off the engine. Turn on the hazard warning indicators.

2. Let the car sit for a minute. Open the hood and check the oil level (see page 148). Although oil level and oil pressure are not directly connected, an engine that is very low on oil can lose pressure during cornering and other driving maneuvers.

3. If necessary, add oil to bring the level back to the full mark on the dipstick (see page 195).

4. Start the engine and watch the oil pressure indicator. If the light does not go out within ten seconds, turn off the engine. There is a mechanical problem that needs to be repaired before you can continue driving. (See Emergency Towing on page 282.)

The engine running generates the oil pressure. When the Auto Idle Stop is activated, the engine is stopped, the oil pressure is dropped, and the low oil pressure indicator does not light.
This indicator should come on when the ignition switch is ON (II), and go out after the engine starts. If it comes on brightly when the engine is running, it indicates that the charging system has stopped charging the battery.

Immediately turn off all electrical accessories: radio, heater, A/C, rear defogger, cruise control, etc. Try not to use other electrically-operated controls such as the power windows. Keep the engine running and take extra care not to stall it. Starting the engine will discharge the battery rapidly.

By eliminating as much of the electrical load as possible, you can drive several miles (kilometers) before the battery is too discharged to keep the engine running. Drive to a service station or garage where you can get technical assistance.

If the Auto Idle Stop is active for an extended period, the charging system indicator may come on. If it happens, start the engine.

The charging system indicator may also come on if the Integrated Motor Assist (IMA) battery charge drops below a desired level and the engine starts to recharge the battery.

This indicator may blink after you start the car in the morning when the temperature is below −20°F (−30°C). It will stop blinking when the IMA battery warms up.
If you have recently refueled your car, the cause of this indicator coming on could be a loose or missing fuel fill cap. Check the cap and tighten it until it clicks several times. Replace the fuel fill cap if it is missing. Tightening the cap will not make the indicator turn off immediately; it takes one driving trip.

If the indicator remains on past one driving trip, or the fuel cap was not loose or missing, have the car checked by the dealer as soon as possible. Drive moderately until the dealer has inspected the problem. Avoid full-throttle acceleration and driving at high speed.

You should also have the dealer inspect your car if this indicator comes on repeatedly, even though it may turn off as you continue driving.

**NOTICE**

If you keep driving with the malfunction indicator lamp on, you can damage your car’s emissions controls and engine. Those repairs may not be covered by your car’s warranties.

This indicator may also come on along with the “D” indicator.

This indicator should light when the ignition switch is ON (II), and go out after the engine starts. If it comes on at any other time, it indicates one of the engine’s emissions control systems may have a problem. Even though you may feel no difference in your car’s performance, it can reduce your fuel economy and cause your car to put out excessive emissions. Continued operation may cause serious damage.
Readiness Codes
Your car has certain “readiness codes” that are part of the on-board diagnostics for the emissions systems. In some states, part of the emissions testing is to make sure these codes are set. If they are not set, the test cannot be completed.

If your car’s battery has been disconnected or gone dead, these codes are erased. It takes several days of driving under various conditions to set the codes again.

If possible, do not take your car for a state emissions test until the readiness codes are set. Refer to State Emissions Testing for more information. (See page 297.)

To check if they are set, turn the ignition ON (II), but do not start the engine. The Malfunction Indicator Lamp will come on for 20 seconds. If it then goes off, the readiness codes are set. If it blinks 5 times, the readiness codes are not set.
Slow down by shifting to a lower gear, and pull to the side of the road when it is safe. Because of the longer distance needed to stop, it is hazardous to drive the car. You should have it towed, and repaired as soon as possible. (See Emergency Towing on page 282.)

If you must drive the car a short distance in this condition, drive slowly and cautiously.

On models equipped with ABS
If the ABS indicator comes on with this indicator, have the vehicle inspected by your Honda dealer immediately.

The Brake System Indicator normally comes on when you turn the ignition switch ON (II). It is a reminder to check the parking brake. It comes on and stays lit if you do not fully release the parking brake.

If it comes on at any other time, it indicates a problem with the car’s brake system. In most cases, the problem is a low fluid level in the brake fluid reservoir. Press lightly on the brake pedal to see if it feels normal. If it does, check the brake fluid level the next time you stop at a service station (see page 209). If the fluid level is low, take the car to your dealer and have the brake system inspected for leaks or worn brake pads.

However, if the brake pedal does not feel normal, you should take immediate action. Because of the brake system's dual-circuit design, a problem in one part of the system will still give you braking at two wheels. You will feel the brake pedal go down much farther before the car begins to slow down, and you will have to press harder on the pedal. The distance needed to stop will be much longer.
All the electrical circuits in your car have fuses to protect them from a short circuit or overload. These fuses are located in three fuse boxes.

The under-hood fuse box is located in the engine compartment on the driver’s side. To open it, push the tabs as shown.

The secondary fuse box is located in the engine compartment. To open it, push the tabs as shown.
Checking and Replacing Fuses

If something electrical in your car stops working, the first thing you should check for is a blown fuse. Determine from the chart on pages 280 and 281, or the diagram on the fuse box lid, which fuse or fuses control that component. Check those fuses first, but check all the fuses before deciding that a blown fuse is not the cause. Replace any blown fuses and check the component’s operation.

1. Turn the ignition switch to LOCK (0). Make sure the headlights and all other accessories are off.

2. Remove the cover from the fuse box.

3. Check each of the large fuses in the under-hood fuse box by looking through the top at the wire inside. Removing these fuses requires a Phillips-head screwdriver.
If you cannot drive the car without fixing the problem, and you do not have a spare fuse, take a fuse of the same rating or a lower rating from one of the other circuits. Make sure you can do without that circuit temporarily (such as the accessory power socket or radio).

If you replace the blown fuse with a spare fuse that has a lower rating, it might blow out again. This does not indicate anything wrong. Replace the fuse with one of the correct rating as soon as you can.

4. Check the smaller fuses in the under-hood fuse boxes and all the fuses in the interior fuse box by pulling out each fuse with the fuse puller provided in the under-hood fuse box.

5. Look for a burned wire inside the fuse. If it is burned, replace it with one of the spare fuses of the same rating or lower.
If the replacement fuse of the same rating blows in a short time, there is probably a serious electrical problem in your car. Leave the blown fuse in that circuit and have your car checked by a qualified mechanic.

If the radio fuse is removed, the audio system will disable itself. The next time you turn on the radio you will see “CODE” in the frequency display. Use the Preset buttons to enter the five-digit code (see page 137).

When the audio system is disabled, the clock setting in the audio system will be canceled. You will need to reset the clock according to the instructions in the audio system section on this owner’s manual.

Taking Care of the Unexpected  281
Emergency Towing

If your car needs to be towed, call a professional towing service or, if you belong to one, an organization that provides roadside assistance. Never tow your car behind another vehicle with just a rope or chain. It is very dangerous.

There are three popular types of professional towing equipment.

*Flat-bed Equipment* — The operator loads your car on the back of a truck. **This is the best way to transport your Honda.**

*Wheel-lift Equipment* — The tow truck uses two pivoting arms that go under the tires (front or rear) and lift them off the ground. The other two tires remain on the ground. **This is an acceptable way to tow your Honda.**

*Sling-type Equipment* — The tow truck uses metal cables with hooks on the ends. These hooks go around parts of the frame or suspension and the cables lift that end of the car off the ground. Your car’s suspension and body can be seriously damaged. **This method of towing is unacceptable.**

If your Honda cannot be transported by flat-bed, it should be towed by wheel-lift equipment with the front wheels off the ground. If due to damage, your car must be towed with the front wheels on the ground, do the following:

5-speed Manual Transmission
- Release the parking brake.
- Shift the transmission to Neutral.

Automatic transmission (CVT)
- Release the parking brake.
- Start the engine.
- Shift to D, then to N.
- Turn off the engine.

**NOTICE**

Improper towing preparation will damage the transmission. Follow the above procedure exactly. If you cannot shift the transmission or start the engine (automatic transmission), your car must be transported with the front wheels off the ground.
With the front wheels on the ground, it is best to tow the car no farther than 50 miles (80 km), and keep the speed below 35 mph (55 km/h).

If your car is equipped with a front spoiler, remove it before towing so it is not damaged.

If you decide to tow your car with all four wheels on the ground, make sure you use a properly-designed and attached tow bar. Prepare the car for towing as described above, and leave the ignition switch in Accessory (I) so the steering wheel does not lock. Make sure the radio and any items plugged into the accessory power socket are turned off so they do not run down the battery.

**NOTICE**

*The steering system can be damaged if the steering wheel is locked. Leave the ignition switch in Accessory (I), and make sure the steering wheel turns freely before you begin towing.*

**NOTICE**

*Trying to lift or tow your car by the bumpers will cause serious damage. The bumpers are not designed to support the car’s weight.*
The diagrams in this section give you the dimensions and capacities of your Honda, and the locations of the identification numbers. It also includes information you should know about your vehicle’s tires and emissions control systems.

Your car has several identifying numbers located in various places.

The Vehicle Identification Number (VIN) is the 17-digit number your Honda dealer uses to register your car for warranty purposes. It is also necessary for licensing and insuring your car. The easiest place to find the VIN is on a plate fastened to the top of the dashboard. You can see it by looking through the windshield on the driver's side. It is also on the Certification label attached to the driver's doorjamb, and is stamped on the engine compartment bulkhead. The VIN is also provided in bar code on the Certification label.
The Engine Number is stamped into the engine block.

The Transmission Number is on a label on top of the transmission.

The IMA Motor Number is stamped on the motor housing.

*1: Without ABS  
*2: With ABS
The treadwear grade is a comparative rating based on the wear rate of the tire when tested under controlled conditions on a specified government test course. For example, a tire graded 150 would wear one and one-half (1 1/2) times as well on the government course as a tire graded 100. The relative performance of tires depends upon the actual conditions of their use, however, and may depart significantly from the norm due to variations in driving habits, service practices and differences in road characteristics and climate.

Treadwear
The treadwear grade is a comparative rating based on the wear rate of the tire when tested under controlled conditions on a specified government test course. For example, a tire graded 150 would wear one and one-half (1 1/2) times as well on the government course as a tire graded 100. The relative performance of tires depends upon the actual conditions of their use, however, and may depart significantly from the norm due to variations in driving habits, service practices and differences in road characteristics and climate.

Traction — AA, A, B, C
The traction grades, from highest to lowest, are AA, A, B, and C. Those grades represent the tire’s ability to stop on wet pavement as measured under controlled conditions on specified government test surfaces of asphalt and concrete. A tire marked C may have poor traction performance.

Warning: The traction grade assigned to this tire is based on straight-ahead braking traction tests, and does not include acceleration, cornering, hydroplaning, or peak traction characteristics.

The tires on your car meet all U.S. Federal Safety Requirements. All tires are also graded for treadwear, traction, and temperature performance according to Department of Transportation (DOT) standards. The following explains these gradings.

Uniform Tire Quality Grading
Quality grades can be found where applicable on the tire sidewall between the tread shoulder and the maximum section width. For example:

Treadwear 200
Traction AA
Temperature A

All passenger car tires must conform to Federal Safety Requirements in addition to these grades.
**Temperature — A, B, C**
The temperature grades are A (the highest), B, and C, representing the tire’s resistance to the generation of heat and its ability to dissipate heat when tested under controlled conditions on a specified indoor laboratory test wheel. Sustained high temperature can cause the material of the tire to degenerate and reduce tire life, and excessive temperature can lead to sudden tire failure. The grade C corresponds to a level of performance which all passenger car tires must meet under the Federal Motor Vehicle Safety Standard No. 109. Grades B and A represent higher levels of performance on the laboratory test wheel than the minimum required by law.

**Warning:** The temperature grade for this tire is established for a tire that is properly inflated and not over-loaded. Excessive speed, underinflation, or excessive loading, either separately or in combination, can cause heat buildup and possible tire failure.
Some conventional gasolines are being blended with alcohol or an ether compound. These gasolines are collectively referred to as oxygenated fuels. To meet clean air standards, some areas of the United States and Canada use oxygenated fuels to help reduce emissions.

If you use an oxygenated fuel, be sure it is unleaded and meets the minimum octane rating requirement.

Before using an oxygenated fuel, try to confirm the fuel's contents. Some states/provinces require this information to be posted on the pump.

The following are the U.S. EPA and Canadian CGSB approved percentages of oxygenates:

**ETHANOL** (ethyl or grain alcohol)
You may use gasoline containing up to 10 percent ethanol by volume. Gasoline containing ethanol may be marketed under the name “Gasohol.”

**MTBE** (Methyl Tertiary Butyl Ether)
You may use gasoline containing up to 15 percent MTBE by volume.

**METHANOL** (methyl or wood alcohol)
Your vehicle was not designed to use fuel that contains methanol. Methanol can corrode metal parts in the fuel system, and also damage plastic and rubber components. This damage would not be covered by your warranties.

If you notice any undesirable operating symptoms, try another service station or switch to another brand of gasoline.

Fuel system damage or performance problems resulting from the use of an oxygenated fuel containing more than the percentages of oxygenates given above are not covered under warranty.
If you are planning to take your Honda outside the U.S. or Canada, contact the tourist bureaus in the areas you will be traveling in to find out about the availability of unleaded gasoline with the proper octane rating.

If unleaded gasoline is not available, be aware that using leaded gasoline in your Honda will affect performance and fuel mileage, and damage its emissions controls. It will no longer comply with U.S. and Canadian emissions regulations, and will be illegal to operate in North America. To bring your car back into compliance will require the replacement of several components, such as the oxygen sensors and the three way catalytic converter. These replacements are not covered under warranty.
The United States Clean Air Act sets standards for automobile emissions. It also requires that automobile manufacturers explain to owners how their emissions controls work and what to do to maintain them. This section summarizes how the emissions controls work. Scheduled maintenance is on page 186.

* In Canada, Honda vehicles comply with the Canadian emission requirements, as specified in an agreement with Environment Canada, at the time they are manufactured.

**Crankcase Emissions Control System**
Your car has a Positive Crankcase Ventilation System. This keeps gasses that build up in the engine’s crankcase from going into the atmosphere. The Positive Crankcase Ventilation valve routes them from the crankcase back to the intake manifold. They are then drawn into the engine and burned.

**Evaporative Emissions Control System**
As gasoline evaporates in the fuel tank, an evaporative emissions control canister filled with charcoal adsorbs the vapor. It is stored in this canister while the engine is off. After the engine is started and warmed up, the vapor is drawn into the engine and burned during driving.

**Onboard Refueling Vapor Recovery**
The Onboard Refueling Vapor Recovery (ORVR) system captures the fuel vapors during refueling. The vapors are adsorbed in a canister filled with activated carbon. While driving, the fuel vapors are drawn into the engine and burned off.
Exhaust Emissions Controls
The exhaust emissions controls include four systems: PGM-FI, Ignition Timing Control, Exhaust Gas Recirculation and Three Way Catalytic Converter. These four systems work together to control the engine’s combustion and minimize the amount of HC, CO, and NOx that comes out the tailpipe. The exhaust emissions control systems are separate from the crankcase and evaporative emissions control systems.

PGM-FI System
The PGM-FI System uses sequential multiport fuel injection. It has three subsystems: Air Intake, Engine Control, and Fuel Control. The Engine Control Module (ECM) uses various sensors to determine how much air is going into the engine. It then controls how much fuel to inject under all operating conditions.

Ignition Timing Control System
This system constantly adjusts the ignition timing, reducing the amount of HC, CO and NOx produced.

Exhaust Gas Recirculation (EGR) System
The Exhaust Gas Recirculation (EGR) system takes some of the exhaust gas and routes it back into the intake manifold. Adding exhaust gas to the air/fuel mixture reduces the amount of NOx produced when the fuel is burned.

Three Way Catalytic Converter
The three way catalytic converter is in the exhaust system. Through chemical reactions, it converts HC, CO, and NOx in the engine’s exhaust to carbon dioxide (CO₂), dinitrogen (N₂), and water vapor.

Replacement Parts
The emissions control systems are designed and certified to work together in reducing emissions to levels that comply with the Clean Air Act. To make sure the emissions remain low, you should use only new Honda replacement parts or their equivalent for repairs. Using lower quality parts may increase the emissions from your car.

The emissions control systems are covered by warranties separate from the rest of your car. Read your warranty manual for more information.
The three way catalytic converter contains precious metals that serve as catalysts, promoting chemical reactions to convert the exhaust gasses without affecting the metals. The catalytic converter is referred to as a three-way catalyst, since it acts on HC, CO, and NOx. A replacement unit must be an original Honda part or its equivalent.

The three way catalytic converter must operate at a high temperature for the chemical reactions to take place. It can set on fire any combustible materials that come near it. Park your car away from high grass, dry leaves, or other flammables.

A defective three way catalytic converter contributes to air pollution, and can impair your engine’s performance. Follow these guidelines to protect your car’s three way catalytic converter.

- Always use unleaded gasoline. Even a small amount of leaded gasoline can contaminate the catalyst metals, making the three way catalytic converter ineffective.
- Keep the engine tuned-up.
- Have your car diagnosed and repaired if it is misfiring, back-firing, stalling, or otherwise not running properly.
If you take your vehicle for a state emissions test shortly after the battery has been disconnected or gone dead, it may not pass the test. This is because of certain “readiness codes” that must be set in the on-board diagnostics for the emissions systems. These codes are erased when the battery is disconnected, and set again only after several days of driving under a variety of conditions.

If the testing facility determines that the readiness codes are not set, you will be requested to return at a later date to complete the test. If you must get the vehicle re-tested within the next two or three days, you can condition the vehicle for re-testing by doing the following.

- Make sure the gas tank is nearly, but not completely, full (around 3/4).
- Make sure the vehicle has been parked with the engine off for 8 hours or more.
- Make sure the ambient temperature is between 20° and 95°F.
- Without touching the accelerator pedal, start the engine and let it idle for 20 seconds.
- Keep the vehicle in Park (automatic transmission) or Neutral (manual transmission). Increase the engine speed to 2,000 rpm and hold it there until the temperature gauge rises to at least 1/4 of the scale (approximately 3 minutes).

Technical Information 297
Then drive in city/suburban traffic for at least 10 minutes. When traffic conditions allow, let the vehicle coast for several seconds without using the accelerator pedal or the brake pedal.

If the testing facility determines the readiness codes are still not set, see your Honda dealer.

Select a nearby lightly traveled major highway where you can maintain a speed of 50 to 60 mph (80 to 97 km/h) for at least 20 minutes. Drive on the highway in D (CVT) or 5th (M/T). Do not use the cruise control. When traffic allows, drive for 90 seconds without moving the accelerator pedal. (Vehicle speed may vary slightly; this is okay.) If you cannot do this for a continuous 90 seconds because of traffic conditions, drive for at least 30 seconds, then repeat it two more times (for a total of 90 seconds).
Honda dealership personnel are trained professionals. They should be able to answer all your questions. If you encounter a problem that your dealership does not solve to your satisfaction, please discuss it with the dealership’s management. The Service Manager or General Manager can help. Almost all problems are solved in this way.

If you are dissatisfied with the decision made by the dealership’s management, contact your Honda Customer Relations Office.

---

When you call or write, please give us this information:

- Vehicle Identification Number (see page 286)
- Name and address of the dealer who services your car
- Date of purchase
- Mileage on your car
- Your name, address, and telephone number
- A detailed description of the problem
- Name of the dealer who sold the car to you
U.S. Owners
Your new Honda is covered by these warranties:

**New Vehicle Limited Warranty** — covers your new vehicle, except for the battery, emissions control systems and accessories, against defects in materials and workmanship.

**Emissions Control Systems Defects Warranty and Emissions Performance Warranty** — these two warranties cover your vehicle’s emissions control systems. Time, mileage, and coverage are conditional. Please read the warranty manual for exact information.

**Original Equipment Battery Limited Warranty** — this warranty gives up to 100 percent credit toward a replacement battery.

**Replacement Battery Limited Warranty** — provides prorated coverage for a replacement battery purchased from a Honda dealer.

**Replacement Muffler Lifetime Limited Warranty** — provides coverage for as long as the purchaser of the muffler owns the car.

Restrictions and exclusions apply to all these warranties. Please read the 2003 Honda Warranty Information booklet that came with your car for precise information on warranty coverages. Your Honda’s original tires are covered by their manufacturer. Tire warranty information is in a separate booklet.

**Canadian Owners**
Please refer to the 2003 Warranty Manual that came with your car.
If you believe that your vehicle has a defect which could cause a crash or could cause injury or death, you should immediately inform the National Highway Traffic Safety Administration (NHTSA) in addition to notifying American Honda Motor Co., Inc.

If NHTSA receives similar complaints, it may open an investigation, and if it finds that a safety defect exists in a group of vehicles, it may order a recall and remedy campaign. However, NHTSA cannot become involved in individual problems between you, your dealer, or American Honda Motor Co., Inc.

To contact NHTSA, you may either call the Auto Safety Hotline toll-free at 1-800-424-9393 (or 366-0123 in Washington D.C. area) or write to: NHTSA, U.S. Department of Transportation, Washington, D.C. 20590. You can also obtain other information about motor vehicle safety from the Hotline.
Valid only for sales within the U.S. Canadian owners should contact their authorized Honda dealer.

ORDER TOLL FREE: 1-800-782-4356
(NOTE: For Credit Card Holder Orders Only)
Monday-Friday 8:00 A.M. — 6:00 P.M. EST
MINIMUM CREDIT CARD PURCHASE $10.00

By completing this form you can order the materials desired. You can pay by check or money order, or charge to your credit card. Mail to Helm Incorporated at the address shown on the back of the order form.

* Prices are subject to change without notice and without incurring obligation.

Orders are mailed within 10 days. Please allow adequate time for delivery.
This manual describes the procedures involved in the replacement of damaged body parts.

**Service Manual:**
This manual covers maintenance and recommended procedures for repair to engine and chassis components. It is written for the Journeyman mechanic, but is simple enough for most mechanically-inclined owners to understand.

**Electrical Troubleshooting Manual:**
This manual complements the Service Manual by providing in-depth troubleshooting information for each electrical circuit in your vehicle.

**Body Repair Manual:**
This manual describes the procedures involved in the replacement of damaged body parts.

* : U.S. and Canada only
**Gasoline:**
Unleaded gasoline, pump octane number of 86 or higher.

**Fuel Tank Capacity:**
13.2 US gal (50 l, 11.0 Imp gal)

**Recommended Engine Oil:**
API Premium grade 0W-20 detergent oil (see page 195).

Oil change capacity (including filter):
- 3.4 US qt (3.2 l, 2.8 Imp qt)

**Automatic Transmission Fluid (CVT):**
Use Honda ATF-Z1 (Automatic Transmission Fluid) only.

Capacity:
- 3.4 US qt (3.2 l, 2.8 Imp qt)

**5-speed Manual Transmission Fluid:**
Honda Manual Transmission Fluid preferred, or an SAE 10W-30 or 10W-40 motor oil as a temporary replacement (see page 208).

Capacity (including differential):
- 1.6 US qt (1.5 l, 1.3 Imp qt)

**Brake Fluid:**
Honda Heavy Duty Brake Fluid DOT 3 preferred, or a DOT 3 or DOT 4 brake fluid as a temporary replacement (see page 209).

**Tire Pressure (measured cold):**
Front/Rear:
- 30 psi (210 kPa, 2.1 kgf/cm²)

Spare Tire:
- 60 psi (420 kPa, 4.2 kgf/cm²)
