

1. Open the trunk.

 $2. \ \textit{V6 models}$

Remove the trim clips from the right or left corner of the trunk lid trim by carefully prying them using a small, flat-tip screwdriver wrapped with tape.

- 3. Carefully bend back the corner of the trunk lid trim to expose the bulbs.
- 4. Remove the socket by turning it one-quarter turn counterclockwise, and pull the bulb straight out of its socket.

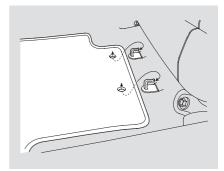

- 5. Install a new bulb into the socket, and reinstall the socket into the light assembly.
- 6. Test the light.
- 7. Push the trunk lid trim back into position.
- 8. Press the trim clips back into their holes.

Cleaning the Seat Belts, Floor Mats

Cleaning the Seat Belts

If your seat belts get dirty, use a soft brush with a mixture of mild soap and warm water to clean them. Do not use bleach, dye, or cleaning solvents. Let the belts air-dry before you use the vehicle. Dirt build-up in the loops of the seat belt anchors can cause the belts to retract slowly. Wipe the insides of the loops with a clean cloth dampened in mild soap and warm water or isopropyl alcohol.

Floor Mats

The driver's and right rear floor mats that came with your vehicle hook over the floor mat anchors. This keeps the floor mats from sliding forward and possibly interfering with the pedals or making the front passenger's weight sensors ineffective. If you remove the floor mats, make sure to re-anchor them when you put them back in your vehicle.

A non-Honda floor mat may not fit your vehicle properly. This could prevent the proper operation of the folding rear seats and the passenger's seat weight sensors. We recommend using genuine Honda floor mats. Do not put additional floor mats on top of the anchored mats.

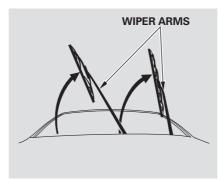

Dust and Pollen Filter

This filter removes the dust and pollen that is brought in from the outside through the heating and cooling system.

Have your dealer replace the filter when this service is indicated by a maintenance message on the information display. It should be replaced every 15,000 miles (24,000 km) if you drive primarily in urban areas that have high concentrations of soot in the air, or if the flow from the heating and cooling system becomes less than usual.

Wiper Blades

Check the condition of the wiper blades at least every six months. Look for signs of cracking in the rubber, or areas that are getting hard. Replace the blades if you find these signs, or if they leave streaks and unwiped areas when used.

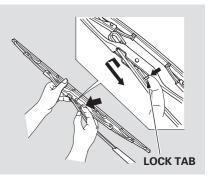

To replace a wiper blade:

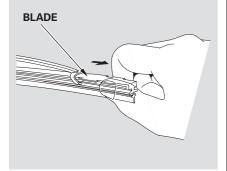

1. Raise the wiper arm off the windshield. Raise the driver's side first, then the passenger's side.

NOTICE

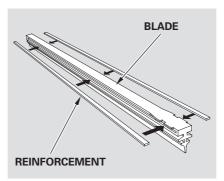

Do not open the hood when the wiper arms are raised, or you will damage the hood and wiper arms.

2. Disconnect the blade assembly from the wiper arm by pushing in the lock tab. Hold the lock tab in while you push the blade assembly toward the base of the arm.

3. Remove the blade from its holder by grasping the tabbed end of the blade. Pull firmly until the tabs come out of the holder.

4. Examine the new wiper blades. If they have no plastic or metal reinforcement along the back edge, remove the metal reinforcement strips from the old wiper blade, and install them in the slots along the edge of the new blade.

- 5. Slide the new wiper blade into the holder until the tabs lock.
- 6. Slide the wiper blade assembly onto the wiper arm. Make sure it locks in place.
- 7. Lower the wiper arm down against the windshield, the passenger's side first, then the driver's side.

To safely operate your vehicle, your tires must be the proper type and size, in good condition with adequate tread, and correctly inflated.

The following pages give more detailed information on how to take care of your tires and what to do when they need to be replaced.

AWARNING

Using tires that are excessively worn or improperly inflated can cause a crash in which you can be seriously hurt or killed.

Follow all instructions in this owner's manual regarding tire inflation and maintenance.

Inflation Guidelines

Keeping the tires properly inflated provides the best combination of handling, tread life, and riding comfort.

- Underinflated tires wear unevenly, adversely affect handling and fuel economy, and are more likely to fail from being overheated.
- Overinflated tires can make your vehicle ride harshly, are more prone to damage from road hazards, and wear unevenly.

We recommend that you visually check your tires every day. If you think a tire might be low, check it immediately with a tire gauge. Use a gauge to measure the air pressure in each tire at least once a month. Even tires that are in good condition may lose 1 to 2 psi (10 to 20 kPa, 0.1 to 0.2 kgf/cm²) per month. Remember to check the spare tire at the same time.

Check the air pressures when the tires are cold. This means the vehicle has been parked for at least 3 hours, or driven less than 1 mile (1.6 km). Add or release air, if needed, to match the recommended cold tire pressures on the next page. If you check air pressures when the tires are hot (driven for several miles), you will see readings 4 to 6 psi (30 to 40 kPa, 0.3 to 0.4 kgf/cm²) higher than the cold readings. This is normal. Do not let air out to match the recommended cold air pressure. The tire will be underinflated.

You should get your own tire pressure gauge whenever you check your tire pressures. This will make it easier for you to tell if a pressure loss is due to a tire problem and not due to a variation between gauges.

While tubeless tires have some ability to self-seal if they are punctured, you should look closely for punctures if a tire starts losing pressure. **Recommended Tire Pressures** The following chart shows the recommended cold tire pressures for most normal driving conditions.

Tire Size	Cold Tire Pressure
	for Normal Driving
P195/65R15 89H 1	Front:
P205/60R16 91V 2	32 psi (220 kPa ,
	2.2 kgf/cm ²)
	Rear:
	30 psi (210 kPa ,
	2.1 kgf/cm ²)
P205/65R15 92H 3	Front:
	30 psi (210 kPa ,
	2.1 kgf/cm ²)
	Rear:
	29 psi (200 kPa ,
	2.0 kgf/cm ²)

1: U.S. VP

2: U.S. SE, EX, and EX-L

Canadian DX-G, SE, and EX-L

3: U.S. LX

Tire Size	Cold Tire Pressure
	for Normal Driving
P215/50R17 93V 4	Front:
	32 psi (220 kPa ,
	2.2 kgf/cm ²)
	Rear:
	29 psi (200 kPa ,
	2.0 kgf/cm ²)

4: V6 models

The compact spare tire pressure is: 60 psi (420 kPa , 4.2 kgf/cm²)

For convenience, the recommended tire sizes and cold tire pressures are on a label on the driver's doorjamb.

For additional information about your tires, see page 271.
