Airbag System Components

(1) Driver’s Airbag
(2) Front Passenger’s Airbag
(3) Control Unit
(4) Front Seat Belt Tensioners
(5) Side Airbags
(6) Driver’s Seat Position Sensor
(7) Front Passenger’s Weight Sensors
(8) Front Impact Sensors
(9) Passenger Airbag Off Indicator
(10) Side Impact Sensors (First)
(11) Occupant Position Detection System (OPDS) Sensors
(12) Front Passenger’s Weight Sensors/OPDS Sensors Control Unit
(13) Seat Belt Buckle Tensioners
(14) Rear Safing Sensor
Your airbag system includes:

- Two SRS (supplemental restraint system) front airbags. The driver’s airbag is stored in the center of the steering wheel; the front passenger’s airbag is stored in the dashboard. Both are marked “SRS AIRBAG” (see page 24).

- Two side airbags, one for the driver and one for a front passenger. The airbags are stored in the outer edges of the seatbacks. Both are marked “SIDE AIRBAG” (see page 27).

- Two side curtain airbags, one for each side of the vehicle. The airbags are stored in the ceiling, above the side windows. The front and rear pillars are marked “SIDE CURTAIN AIRBAG” (see page 29).
Additional Information About Your Airbags

- Automatic front seat belt tensioners (see page 19).
- Sensors that can detect a moderate to severe front impact or side impact.
- Sensors that can detect whether a child is in the passenger’s side airbag path and signal the control unit to turn the airbag off (see page 28).
- Sensors that can detect whether the driver’s seat belt and a front passenger’s seat belt is latched or unlatched (see page 18).
- A driver’s seat position sensor that monitors the distance of the seat from the front airbag. If the seat is too far forward, the airbag will inflate with less force (see page 26).
- Weight sensors that monitor the weight on the front passenger’s seat. If the weight is about 65 lbs (29 kg) or less (the weight of an infant or small child), the passenger’s front airbag will be turned off (see page 26).
- A sophisticated electronic system that continually monitors and records information about the sensors, the control unit, the airbag activators, the seat belt tensioners, and driver and front passenger seat belt use when the ignition switch is in the ON (II) position.
- An indicator on the instrument panel that alerts you to a possible problem with your airbags, sensors, or seat belt tensioners (see page 29).
- An indicator on the instrument panel that alerts you that the passenger’s side airbag has been turned off (see page 30).
- An indicator on the dashboard that alerts you that the passenger’s front airbag has been turned off (see page 30).
- Emergency backup power in case your vehicle’s electrical system is disconnected in a crash.
After inflating, the front airbags immediately deflate, so they won't interfere with the driver's visibility, or the ability to steer or operate other controls.

The total time for inflation and deflation is one-tenth of a second, so fast that most occupants are not aware that the airbags deployed until they see them lying in their laps.
After a crash, you may see what looks like smoke. This is actually powder from the airbag's surface. Although the powder is not harmful, people with respiratory problems may experience some temporary discomfort. If this occurs, get out of the vehicle as soon as it is safe to do so.

**Dual-Stage Airbags**

Your front airbags are dual-stage airbags. This means they have two inflation stages that can be ignited sequentially or simultaneously, depending on crash severity.

In a more severe crash, both stages will ignite simultaneously to provide the quickest and greatest protection.

In a less severe crash, one stage will ignite first, then the second stage will ignite a split second later. This provides longer airbag inflation time with a little less force.

**Dual-Threshold Airbags**

Your front airbags are also dual-threshold airbags. Airbags with this feature have two deployment thresholds that depend on whether sensors detect the occupant is wearing a seat belt or not.

If the occupant’s belt is not latched, the airbag will deploy at a slightly lower threshold, because the occupant would need extra protection.

If the occupant’s belt is latched, the airbag will inflate at a slightly higher threshold, when the airbag would be needed to supplement the protection provided by the seat belt.

**Advanced Airbags**

Your front airbags are also advanced airbags. The main purpose of this feature is to help prevent airbag-caused injuries to short drivers and children who ride in front.

For both advanced airbags to work properly:

- Occupants must sit upright and wear their seat belts properly.
- Do not spill any liquids on or under the seats, cover the sensors, or put any objects or metal items under the front seats.
- Back-seat passengers should not put their feet under the front seats.

Failure to follow these instructions could damage the sensors or prevent them from working properly.

The driver’s advanced front airbag system includes a seat position sensor under the seat. If the seat is too far forward, the airbag will inflate with less force, regardless of the severity of the impact.

If there is a problem with the sensor, the SRS indicator will come on, and the airbag will inflate in the normal manner regardless of the driver’s seating position.

The passenger’s advanced front airbag system has weight sensors under the seat. Although Honda does not encourage carrying an infant or small child in front, if the sensors detect the weight of an infant or small child (up to about 65 lbs or 29 kg), the system will automatically turn the passenger’s front airbag off.

Do not spill any liquids on or under the seats, cover the sensors, or put any objects or metal items under the front seats.
Be aware that objects placed on the passenger’s seat can also cause the airbag to be turned off.

When the airbag is turned off, a “passenger airbag off” indicator in the center of the dashboard comes on (see page 30).

If the weight sensors detect there is no passenger in the front seat, the airbag will be off. However, the passenger airbag off indicator will not come on.

To ensure that the passenger’s advanced front airbag system will work properly, do not do anything that would increase or decrease the weight on the front passenger’s seat. This includes:

- A rear passenger pushing or pulling on the back of the front passenger’s seat.
- Moving the front seat forcibly back against cargo on the seat or floor behind it.
- Moving the front seat or seat-back forcibly back against the folded rear seat.
- Hanging heavy items on the front passenger seat, or placing heavy items in the seat-back pocket.

If your vehicle is equipped with floor mats, make sure the floor mat behind the front passenger’s seat is hooked to the floor mat anchor (see page 242). If it is not, the mat may interfere with the proper operation of the sensors and operation of the seat.

If you ever have a moderate to severe side impact, sensors will detect rapid acceleration and signal the control unit to instantly inflate either the driver’s or the passenger’s side airbag and activate the seat belt tensioner.
